In further response to Patent Office Letter of April 24, 1931, applicant is submitting herewith an Affidavit under Rule 48, setting forth the fact that under normal operating conditions the piston shown and described in the foregoing application is subjected to pressure from the cylinder wall, and that this was known to applicant at the time the invention was made. The remainder of the affidavit is the usual form of supplemental oath.

It is now believed that the claims of this application are in condition for allowance, since the amendments made in the claims of the application were believed to comply with the Examiner's suggestions at the time of counsel's interview with the Examiner about the time of filing the last amendment.

Respectfully submitted,

EDWARD J. GULICK,
By EVANS & MCCOY,
Attorneys.

Paper # 53

IN THE UNITED STATES PATENT OFFICE

Application of
Edward J. Gulick
Serial No. 204,661
Filed Nov. 30, 1917
For Pistons
Div. 12, Room 380.

SUPPLEMENTAL OATH

STATE OF INDIANA }
COUNTY OF ELKHART } ss.

Edward J. Gulick, whose application for Letters Patent for an improvement in Pistons, Serial No. 204,661, was filed in the United States Patent Office on or about the 30th day of November, 1917, being duly sworn, deposes and says:

That the piston shown and described in the aforesaid application is normally fitted in the engine cylinder with an operating clearance; that thermal expansion of the piston during operation normally causes the engine cylinder to exert pressure on the piston body; that this fact was known to him at the time he made his invention disclosed in the aforesaid application for Letters Patent; and that the subject matter of each of the following claims now in this application was part of his invention, was invented before he filed his original application above identified for such invention, was not known or used before his invention, was not patented or described in a printed publication in any country more than two years before his application, was not patented in a foreign country on an application filed by himself or his legal representatives or assigns more than twelve months before his application, was not in public use or on sale in this country for more than two years before the date of his application, and has not been abandoned:

Serial No. 204,661

1. A piston comprising a head, a skirt separated at its periphery from the head, and pin bosses connected to the head and to the upper and lower parts of the skirt, said skirt being split longitudinally at one side between its connections to said bosses.

2. A piston comprising a head, a skirt separated at its periphery from the head, and pin bosses integrally connected to the head and to the upper and lower part of the skirt, the outer ends of the pin bosses being spaced from the opposing parts of the skirt wall and said skirt having openings opposite the open ends of the bosses, said skirt being slit longitudinally on one side between its connections to said bosses.

3. A piston comprising a head, a skirt separated at its periphery from the head, and pin bosses integrally connected to the head and to the skirt in four longitudinal lines, the ends of said bosses being spaced from the opposing parts of the wall of the skirt, said skirt having openings therethrough opposite the open ends of the bosses.

4. A piston comprising a head, a skirt separated at its periphery from the head, and pin bosses connected to the head and also connected to the skirt both above and below the bosses, said skirt being split longitudinally between its connections to said bosses.

5. An integrally cast piston comprising a head, a skirt separated at its periphery from the head, and pin bosses integrally connected to the head and to the skirt at both sides and in the zone of said bosses, the bosses having their ends spaced from the opposing parts of the skirt wall, said skirt being split longitudinally between its connections to said bosses.

Serial No. 204,661

6. An integrally cast piston comprising a head, a skirt, separated piston pin bosses within the skirt, and an integral flange on each of said bosses intermediate its ends, said flange extending from both sides of the boss to the piston skirt and integrally united therewith in the zone of the boss, said flanges being yieldable in the direction of the piston pin boss axis and relatively rigid in the direction of their length.

7. A piston comprising a head, a skirt, separated piston pin bosses integral with the head and disposed within the skirt, and integral transversely flexible webs extending from the intermediate part of each of said bosses to the skirt wall in the zone of the boss for supporting the bosses from the adjacent part of the skirt.

8. A piston comprising a head, a skirt having its periphery separated from the head, pin bosses in the piston spaced from the wall of the skirt and conduits leading from the top of said skirt to the interior of said bosses.

9. A piston comprising a head, a skirt having its periphery separated from the head, pin bosses in the piston, the ends of such bosses being spaced from the walls of the skirt, means integrally connecting the bosses with the head and skirt, and pipes leading from the upper part of the skirt to the bosses.

10. A piston comprising a head, a skirt, separated piston pin bosses within the skirt, and an intermediate flange on each of said bosses intermediate its ends, said flange extending laterally from both sides of the boss to the piston skirt in a curve and integrally united with the skirt in the zone of the boss.

Serial No. 204,661

11. A piston comprising a head portion, a skirt portion, two separated pin bosses, connecting flanges in the zone of the bosses and extending from the bosses to the skirt on both sides of the bosses, connecting means from each of the bosses to the head portion, the skirt portion being entirely separated from the head portion except through the boss connections, and the skirt portion being split longitudinally of the piston to permit free expansion and contraction.

12. A piston comprising a head portion, a skirt portion, two separated pin bosses, connecting flanges in the zone of the bosses and extending from the bosses to the skirt on both sides of the bosses, connecting means from each of the bosses to the head portion, the skirt portion being entirely separated from the head portion except through the boss connections, and the skirt portion being split longitudinally of the piston to permit free expansion and contraction, and the skirt portion being cut away adjacent the outer ends of the piston bosses.

13. A piston having a head portion with a ring groove therein, a skirt portion having its cylinder-engaging part separated from the head portion, separated pin bosses having integral flanges connecting them with the skirt on both sides of the bosses and with the head portion respectively, said skirt being split from top to bottom on one side only of the pin bosses to permit free expansion and contraction of the skirt portion.

—4— 204661—135

Serial No. 204,661

14. A piston for internal combustion engines comprising in combination a head portion having an end wall and a ring-packed side wall, a guide portion having an annular bearing surface at the open end thereof and diametrically opposite cylinder-engaging parts thereof designed to take the angular thrust of a connecting rod and each separated at its upper end from the said side wall of the head portion by an unobstructed air gap, a pair of separated pin bosses disposed on an axis between said cylinder-engaging parts, a pair of longitudinally disposed walls connected to said bosses and each joined at relatively widely separated points to the said cylinder-engaging parts above and below the plane of the boss axis, said walls being disposed within the maximum diameter of the piston, and integral, rigid connections extending from the bosses to the head portion.

15. A piston for internal combustion engines comprising in combination a head portion having an end wall and a side wall, a guide portion having on one side a cylinder-engaging part disposed to take the angular thrust of a connecting rod during one stroke of the piston, said cylinder-engaging part being separated at its upper end from said side wall by an air gap and being split longitudinally to accommodate expansion incident to the heating of the piston, a pair of separated pin bosses, and walls integrally uniting said bosses, the guide portion and the head portion.

—5— 204661—136

Serial No. 204,661

16. A piston for internal combustion engines comprising in combination a head portion having an end wall and a side wall, a guide portion having diametrically opposite cylinder-engaging parts thereof designed to take the angular thrust of a connecting rod and each separated at its upper end from the said side wall by an air

gap and one of said cylinder-engaging parts being split longitudinally from its upper edge to its lower edge, a pair of separated pin bosses disposed on an axis between said cylinder-engaging parts, and walls integrally uniting said bosses, the guide portion and the head portion, said split in the cylinder-engaging face of said guide portion being disposed between the connections thereto of said walls.

17. A piston for internal combustion engines comprising in combination a head portion having an end wall and a side wall, a guide portion having diametrically opposite cylinder-engaging parts thereof designed to take the angular thrust of a connecting rod and arcuate cylinder-engaging parts joining said diametrically opposite parts at the lower end of the guide, the said diametrically opposite parts each being separated at its upper end from the side wall of the head section by an air gap, a pair of separated pin bosses disposed on an axis between said cylinder-engaging parts, a pair of transversely flexible walls integrally connected to said bosses and integrally joined to the cylinder-engaging parts at points above and below the plane of the boss axis, said walls being disposed within the maximum diameter of the piston, and connections extending from the bosses to the head portion and integral therewith.

Serial No. 204,661

19. A piston for internal combustion engines comprising in combination a head portion having an end wall and a side wall, a guide portion having diametrically opposite cylinder-engaging parts thereof designed to take the angular thrust of a connecting rod and each separated at its upper end from the said side wall by an air gap, a pair of separated pin bosses disposed on an axis between said cylinder-engaging parts, a pair of walls connected to said bosses and joined to the said cylinder-engaging parts at points above and below the plane of the boss axis, and rigid, integral connections between the bosses and the head portion comprising upward extensions of said walls with strengthening ribs disposed substantially at right angles thereto.

20. A piston for internal combustion engines comprising in combination a head portion having an end wall and a side wall, a guide portion having diametrically opposite cylinder-engaging parts thereof designed to take

the angular thrust of a connecting rod and each separated at its upper end from the said side wall by an air gap, spaced supporting connections between said head and guide portions, one of said cylinder-engaging parts being split longitudinally from its upper edge to its lower edge between said supporting connections, a pair of separated pin bosses disposed on an axis between said cylinder-engaging parts, a pair of walls disposed within the maximum diameter of the piston and integrally connected to said bosses and to said cylinder-engaging parts and to said head portion.

—7— 204661—138

Serial No. 204,661

21. A piston for internal combustion engines comprising in combination a head portion having an end wall and a side wall, a guide portion having diametrically opposite cylinder-engaging parts thereof designed to take the angular thrust of a connecting rod and each separated at its upper end from the said wall by an air gap and one of said cylinder-engaging parts being split longitudinally from its upper edge to its lower edge, a pair of separated pin bosses disposed on an axis between said cylinder-engaging parts, and walls integrally uniting said bosses, the guide portion and the head portion, the guide structure and said walls being adapted to permit the split of the cylinder-engaging part to close more or less under the action of forces incident to the heating of the piston during operation.

22. A piston comprising in combination a head portion having an end wall and a side wall, a guide portion having diametrically opposite cylinder-engaging parts thereof designed to take the angular thrust of a connecting rod and each separated at its upper end from the said side wall by an air gap, a pair of separated pin bosses disposed on an axis between said cylinder-engaging parts, a pair of walls connected to said bosses and to said cylinder-engaging parts, and connections extending from the bosses to the head section, one of the said cylinder-engaging parts being split longitudinally between the points of attachment thereto of the said walls.

23. In a piston, the combination of a head portion having an end wall and a side wall, a guide portion, a pair of separated piston pin bosses connected to the head portion, and webs disposed longitudinally of the piston in-

tegrally joining the inner parts of said bosses to the guide portion in the zone of said bosses.

—8— 204661—139

Serial No. 204,661

24. A piston for internal combustion engines comprising a head portion, a guide portion, a pair of separated pin bosses connected to the head portion and arranged within the maximum diameter of the piston whereby the outer ends of the bosses will be out of contact with the cylinder wall, and a flange on each of said bosses near its inner end extending laterally from both sides of the boss to the guide portion in a curve and integrally united with the guide portion in the zone of the boss, said flange being disposed longitudinally of the piston.

26. An integrally formed piston for internal combustion engines comprising in combination a head portion having an end wall and a side wall, a pair of separated pin bosses, and a guide portion connected to said bosses and having on one side a cylinder-engaging part disposed to take the angular thrust of a connecting rod during one stroke of the piston, said cylinder-engaging part being separated at its upper end from said side wall of the head portion by an air gap and being split longitudinally between its connections to said bosses to accommodate expansion incident to the heating of the piston.

27. An integrally formed piston for internal combustion engines comprising in combination a head portion having an end wall and a side wall, a guide portion having diametrically opposite cylinder-engaging parts thereof designed to take the angular thrust of a connecting rod and each separated at its upper end from the said side wall by an air gap, spaced supporting connections between said head and guide portions, one of said cylinder-engaging parts being split longitudinally between its supporting connections from its upper edge to its lower edge, and a pair of separated pin bosses disposed on an axis between said cylinder-engaging parts.

—9— 204661—140

Serial No. 204,661

28. A one-piece piston with a solid end portion and a skirt portion supported therefrom by spaced integral connections and having formed in its peripheral face a transverse slot adjacent the solid end of the piston and a

single longitudinal slot in the skirt between the spaced integral connections and extending from the transverse slot to the open end of the piston, said slots forming adjacent disconnected main peripheral bearing portions in the skirt which are capable of unrestrained outward and inward movement, the bearing face of said piston diametrically opposite said longitudinal slot being circumferentially continuous between the spaced integral connections of the skirt to the head on that side of the skirt.

29. A one-piece piston provided with a solid end portion and a skirt portion, said skirt portion having oppositely disposed thrust bearing faces and a longitudinally extending slot formed through the thickness of its wall, said slot extending from the rear edge of the skirt portion through one of said thrust bearing faces and forming adjacent disconnected parts of a thrust bearing face in said skirt portion which are capable of being moved inwardly or outwardly without restraint.

30. A piston comprising a head and body, internal yielding ribs supporting the head and body, and means on said ribs adapted to form engaging connection with operable parts for said piston.

Serial No. 204,661

31. A piston open at one end and having a packing ring supporting portion and a cylinder-engaging portion, said cylinder-engaging portion having a slot which is cut through the thickness of its peripheral wall and extending from the open end of the piston to said ring supporting portion, a pair of wrist pin bearings depended from said ring supporting portion and separated from said cylinder-engaging portion, and tying means extending from each of said wrist pin bearings, each being cooperably connected at their opposite ends to said cylinder-engaging portion.

32. A piston having a head with top and side walls in combination with a guide structure connected thereto and comprising diametrically opposite cylinder-engaging parts formed with air spaces between their upper edges and the bottom edge of the side wall of the head, wrist pin bosses between the cylinder-engaging parts, and means joining said bosses and cylinder-engaging parts together, the said joining means being resiliently yieldable and arranged not to engage the cylinder.

33. A piston closed at one end and open at its opposite end, said piston having an annular cutting formed through the thickness of its peripheral wall, thereby providing a separated sleeve-like skirt which is approximately cylinder-bearing in its entirety, a pair of wrist pin bearings depended from said piston end and being free from engagement with said skirt, supporting means extending from each of said bearings to said skirt, said skirt being provided with a longitudinal slot cut through the thickness of its wall between its connections to said supporting means and extending from the open end thereof to said annular cutting.

Serial No. 204,661

34. A piston for an internal combustion engine cylinder comprising in combination, a head portion having an end wall and a side wall, a guide portion having diametrically opposite cylinder-engaging parts thereof designed to receive the side thrust of a connecting rod and arcuate cylinder-engaging parts joining said diametrically opposite parts at the lower end of the guide portion to provide an annular bearing face adjacent the open end of the piston, each of said diametrically opposite cylinder-engaging parts being separated at its upper end from the side wall of the head portion, a pair of separated pin bosses disposed on an axis between said cylinder-engaging parts, a pair of spaced walls, each of which connects one of said bosses to said cylinder-engaging parts at points above and below the plane of the boss axis, one of said diametrically opposite cylinder-engaging parts being split longitudinally from its upper edge to its lower edge between its connections to said walls, and connections extending from the bosses to the head portion, whereby said piston skirt is rendered yieldable during operation in response to cylinder wall pressure.

35. A piston for use in an engine cylinder comprising a head, a skirt, parts of said skirt forming oppositely positioned main bearing portions designed to take the side thrust of a connecting rod, a pair of spaced wrist pin bosses, means integrally connecting the bosses to the head, and means integrally connecting each boss to both of said opposite main bearing portions, one main bearing portion being circumferentially continuous between its connections to the bosses and the other main bearing portion being separated from the head and slit longi-

tudinally between its connections to the bosses to render said slit main bearing portion yieldable in response to pressure from the engine cylinder during operation.

—12— 204661—143

Serial No. 204,661

36. A piston for use in an engine cylinder comprising a head, a skirt, parts of said skirt forming oppositely positioned main bearing portions to take the side thrust of a connecting rod, a pair of spaced wrist pin bosses, means integrally connecting the bosses to the head, and means integrally connecting each boss to both of said opposite main bearing portions, one main bearing portion being circumferentially continuous between its connections to the bosses and the other main bearing portion being separated from the head and slit longitudinally its entire length between its connections to the bosses to render said slit main bearing portion yieldable in response to pressure from the engine cylinder during operation.

37. A single-piece, integral piston, comprising a head, a pair of spaced wrist pin bosses having a common axis, a skirt, and means yieldingly connecting the skirt to the head, said skirt being integral and having main cylinder-bearing faces disposed on opposite sides of the axis of said wrist pin bosses, said skirt being separated from the head at the upper end of each of said bearing faces, one only of said main cylinder bearing faces being slit longitudinally between its connections to the head, whereby said head may expand and contract during operation of said piston substantially independently of said skirt portion when expansion of the skirt portion is restrained.

—13— 204661—144

Serial No. 204,661

38. A single-piece, integrally cast piston for use in an engine, comprising a head, wrist pin bosses having a common axis, a skirt, and means connecting said head and bosses and skirt together, said skirt being integral and having a main bearing portion disposed on each side of the said wrist pin boss axis and designed to take the side thrust produced by the angularity of the connecting rod of the engine, said piston having a transverse slit through its wall on one side of the boss axis, portions of said skirt on the transversely slit side of the piston also being slit longitudinally between its connections to

said bosses to provide a peripheral main bearing portion in the said transversely slit side of said piston that is capable of yielding in response to pressure from the engine cylinder during operation of the piston.

39. A single-piece, integral piston for operation in an internal combustion engine cylinder, comprising a head, spaced wrist pin bosses, a longitudinally slitted, one-piece skirt that is yieldable in response to cylinder wall pressure having cylinder-engaging faces disposed at opposite sides of the axis of said bosses and designed to yieldingly engage the walls of the cylinder during operation, said head and skirt being separated at the upper end of each of said cylinder-engaging faces, and means yieldingly connecting the skirt to said head including means connecting the bosses and the skirt, said means connecting said bosses and said skirt being substantially rigid in the direction transverse to the axis of the bosses, whereby said head portion may expand and contract during operation of said piston without binding engagement of the skirt with the walls of the cylinder.

Serial No. 204,661

40. A single-piece, integrally cast piston for use in an engine, comprising a head, wrist pin bosses having a common axis, a skirt, and means connecting said head and bosses and skirt together, said skirt being integral and having a main bearing portion disposed on each side of the said wrist pin boss axis and designed to take the side thrust produced by the angularity of the connecting rod of the engine, said piston having a transverse slit through its wall on both sides of the boss axis, one only of said main bearing portions being slit longitudinally between its connections to said bosses to provide a peripheral bearing portion therein that is capable of yielding outward and inward movement relative to the head during operation of the piston.

41. A piston for an engine cylinder comprising a skirt, a head separated from the skirt wall around its entire periphery, said skirt being longitudinally slit to render the skirt wall yieldable on every diameter in response to cylinder wall pressure, wrist pin bosses, and means rigidly connecting said bosses to the head and yieldingly connecting said bosses to the skirt whereby said skirt is yieldable in response to cylinder wall pressure.

42. A piston for an engine cylinder comprising a cylindrical skirt that is longitudinally slit and yieldable on every diameter in response to cylinder wall pressure, a pair of wrist pin bosses having a common axis, said skirt being integral and having a main cylinder bearing portion on each side of the axis of said wrist pin bosses, a head peripherally separated from at least one of said main cylinder-bearing portions, and means connecting the bosses with the skirt, said means being yieldable in the direction of the boss axis and substantially rigid in the direction transverse to said axis, whereby said head may freely expand and contract during operation of the piston when expansion of the skirt is restrained.

—15— 204661—146

Serial No. 204,661

43. A piston comprising a head, a pair of spaced wrist pin bosses rigidly carried by the head and having a common axis, a skirt that is separated from the head on each side of the wrist pin bosses and longitudinally slit between the bosses on one side only of the bosses to render the skirt circumferentially yielding on that side of said bosses and circumferentially non-yielding on the opposite side of said bosses, and means substantially non-yielding in the direction transverse to the boss axis connecting the bosses with the skirt.

44. A piston for an engine cylinder comprising, a head, and an integral guide portion having diametrically opposite cylinder-engaging parts thereof designed to receive the thrust of a connecting rod during operation, one of said cylinder-engaging parts being rigidly connected to the head in the direction of load thrust from the connecting rod, the opposite cylinder-engaging part being yieldable relative to the head in response to cylinder wall pressure, whereby thermal expansion of said piston will not cause it to seize in the cylinder during operation.

45. A piston for an internal combustion engine cylinder, comprising a head portion carrying packing means and an integral guide portion integral with the head portion and having diametrically opposite cylinder-engaging parts thereof designed to receive side thrust from a connecting rod, one of said cylinder-engaging parts being slit longitudinally to render it materially more yielding than the opposite cylinder-engaging part.

EDWARD J. GULICK.

DEPARTMENT OF COMMERCE
UNITED STATES PATENT OFFICE

Washington May 16, 1931.

Edward J. Julick (Assor etc.)

Your Application for a patent for an Improvement in Piston filed Nov. 30, 1917 has been examined and Allowed with 43 claims.

The final fee, Twenty-Five Dollars, With $1 Additional For Each Claim Allowed In Excess Of 20, must be paid not later than Six Months from the date of this present notice of allowance. If the final fee be not paid within that period, the patent will be withheld, but the application may be renewed within one year after the date of the original notice with a renewal fee of $25 and $1 additional for each claim in excess of 20.

The office delivers patents upon the day of their date, on which date their term begins to run. The preparation of the patent for final signing and sealing will require about four weeks, and such work will not be begun until after payment of the necessary final fee.

When the final fee is paid, there should also be sent, Distinctly And Plainly Written, the name of the Inventor, Title Of The Invention, And Serial Number As Above Given, Date Of Allowance (which is the date of this circular), Date Of Filing, and, if assigned, the Names Of The Assignees.

If it is desired to have the patent issue to an Assignee or Assignees, an assignment containing a Request to that effect, together with the Fee for recording the same, must be filed in this office on or before the date of payment of the final fee.

After issue of the patent, uncertified copies of the drawings and specifications may be purchased at the price of Ten Cents Each. The money should accompany the order. Postage stamps will not be received.

The final fee will Not be received from other than the applicant, his assignee or attorney, or a party in interest as shown by the records of the Patent Office.

Notice.—When The Number Of Claims Allowed Is In Excess Of 20, No Sum Less Than $25 Plus $1 Additional For Each Claim In Excess Of Twenty Can Be Accepted As The Final Fee.

Respectfully,

THOMAS E. ROBERTSON,
Commissioner of Patents.

Evans & McCoy,
724 Bulkley Bldg.,
Cleveland, Ohio.

☞ In remitting the final fee give the serial number at the head of this Notice.

☞ Uncertified checks will not be accepted.

Applicant Edward J. Gulick
Ser. No. 204,661
Filed Nov. 30, 1917
For Pistons.

In accordance with the provisions of Order No. 2308, dated March 12, 1917, which reads in part as follows:

* * * * *

> Obvious informalities in the application may be corrected by the examiner, but said correction must be in the form of an amendment, approved by the Principal Examiner in writing, placed in the file, and made a part of the record. The changes specified in the amendment will be entered by the clerk in the regular way.

* * * * *

the changes, hereinafter specified, are made by the examiner in the application above identified.

Should these changes not be satisfactory to the applicant, appropriate amendment may be proposed under the provisions of Rule 78, provided the specification has not been printed.

The application has been amended as follows:

Claim 28, (original claim 27), line 2, —*having*— has been inserted after "portion" and —*and*— after "faces" has been canceled.

Re: *Gulick Patent No. 1,815,733*

Sir:

It is noted that the word "separating" in line 9 of claim 30 of the above designated patent is incorrect, and should read "and separated." P. E.

This claim originated as Count 1 of Interference No. 49,571 wherein the correct wording of the claim appears.

Correction is requested because the language of the claim is incorrect as it now stands in the printed patent.

The original patent is enclosed.

Recommended R. F. W.

Respectfully submitted,
Evans & McCoy.

File Wrapper and Contents of Mooers Patent in Suit.

(Filed January 27, 1934.)

2—390

DEPARTMENT OF THE INTERIOR

UNITED STATES PATENT OFFICE

To all persons to whom these presents shall come, Greeting:

THIS IS TO CERTIFY that the annexed is a true copy from the records of this office of the File Wrapper and Contents, in the matter of the Letters Patent of Louis P. Mooers, Assignor by Direct and Mesne Assignments to The Cleveland Trust Company, Number 1,402,309, Granted January 3, 1922, for Improvement in Pistons for Internal Combustion Motors.

IN TESTIMONY WHEREOF I have hereunto set my hand and caused the seal of the Patent Office to be affixed, at the City of Washington, this 1st day of June, in the year of our Lord, one thousand nine hundred and twenty-three and of the Independence of the United States of America the one hundred and forty-seventh.

WM. A. KINNAN,

(Seal) *Acting Commissioner of Patents.*

U. S. Patent Office

PETITION.

To the Commissioner of Patents:

Your petitioner, Louis P. Mooers, a citizen of the United States, residing at Cincinnati in the County of Hamilton, and State of Ohio, whose Post Office address is care of The Ahrens-Fox Fire Engine Co., Cincinnati, Ohio, prays that Letters Patent may be granted to him for improvements in Piston for Internal Combustion Motor ~~and Process of Making the Same~~ as set forth in the annexed specification.

Per C

And he hereby appoints ~~Edward R. Alexander, of~~ **Hayner H. Gordon, Ouray Building,** Washington, D. C., ~~Reg. No. 6273~~ **Reg. No. 10,822,** as his Attorney, with full power of substitution and revocation, to prosecute this application, to make alterations and amendments therein, to receive the patent, and to transact all business in the Patent Office connected therewith.

LOUIS P. MOOERS.

SPECIFICATION

To All Whom It May Concern:

Be it known that I, Louis P. Mooers, a citizen of the United States, residing at Cincinnati, in the County of Hamilton, and State of Ohio, have invented certain new and useful improvements in and relating to Pis-
Per C ton for Internal Combustion Motor ~~and Process of Making the Same,~~ of which the following is a specification.

3B

Sub. D[1] This invention relates to pistons for use particularly in internal combustion motors and process of making the same.

One of the objects of my invention is to produce a simple, light, durable and efficient skirted piston peculiarly adapted to meet the conditions which exist in an internal combustion motor cylinder, including the stresses and strains imposed upon the piston, principally during the explosion stroke, and by the high heat generated at this time, which heat must be efficiently and economically (a) utilized in the translation of heat into mechanical energy, and (b) that not translated into mechanical energy properly dissipated.

My present invention comprises improvements on the joint invention of myself and Edward O. Spillman disclosed in Letters Patent of the United States No. 1,092,870.

It contemplates simplifying the construction and manufacture of pistons of this patented type and of considerably lightening the construction as compared with the integral cast structure illustrated in the said patent. It further contemplates the disposition of the parts which go to make up the piston relative to each other so that pistons embodying one form of this invention may be made readily in permanent molds.

It further contemplates the idea of dissipating the heat from the head of the piston more effectively, as

—1— 4B

concerns the wrist pin bosses, than is the case with the construction illustrated in the said patent No. 1,092,870.

Other objects of my invention will be obvious to one skilled in the art from the description of one or more embodiments of my idea which I have herein selected to make for the purpose of a comprehensive disclosure of my improvements to one skilled in the art.

In the drawings, Fig. 1 is a longitudinal section of a piston embodying my improvements taken through the axis of the wrist pin bosses.

Fig. 2 is a section on the line 2-2, Fig. 1.

Fig. 3 is a bottom plan view looking into one of my improved pistons.

Fig. 4 is a section on the line 4-4, Fig. 1.

Fig. 5 is a longitudinal section taken through the axis of the wrist pin bosses of a modified form of piston embodying my invention.

Fig. 6 is a section on the line 6-6, Fig. 7.

Fig. 7 is a bottom plan view of the construction of piston illustrated in Fig. 5.

Fig. 8 is a side elevation of a piston casting after being taken from the mold and before any machining is done on it.

Fig. 9 is a side elevation of said piston casting after it has been externally machined and the cut made to provide the air gap between the head and the skirt section of the piston.

—2— 5B

Fig. 10 is a longitudinal section through the axis of the wrist pin bosses of another modified form of my invention.

Fig. 11 is a section on the line 11-11, Fig. 12.

Fig. 12 is a bottom plan view of the piston construction illustrated in Fig. 10.

per A Fig. 13 is a section on the line 13-13, Fig. ~~12~~ 11.

Fig. 14 is a section on the line 14-14, Fig. 10.

—3— 6B

In Figs. 1 to 4 inclusive, 1 is the skirt, body or guide portion of the piston. 2 is the top or piston head. 3 are columns or connectors, preferably integrally formed with the skirt 1 and head 2 for connecting these two parts

of the piston together. The head preferably has an end wall 2' and an outer peripheral wall 2a, the latter formed preferably with suitable piston ring grooves 2b.

Intermediate its ends the guide portion or skirt 1 is preferably formed with inwardly extending, diametrically opposed, aligned, annular wrist pin bosses 1a, 1b, one of which may have a downwardly or laterally extending lug 1c formed with a screw-threaded hole to receive in the well known manner a suitable locking bolt or screw for the wrist pin (not shown).

The upper end of the guide section or skirt is separated from the head 2 by an air gap. In the drawings, purely for the purpose of illustration, this air gap is shown wider than is necessary. The presence of this air gap or air space between the upper edge of the skirt or body section 1 and the lower edge of the peripheral portion 2a of the piston head, insures that the heat absorbed by the piston head principally will be transmitted inwardly and downwardly through the columns 3 so that such portion of it as does reach the skirt or body per C by conveduction will do so at points below said air gap and will be reduced in amount so as to

reduce relatively the expansion of the skirt as compared with the head, thereby permitting the skirt to be fitted relatively closely to the inner walls of the cylinder. While this air gap, as above indicated, has been shown, for the purpose of illustration, wider than necessary, it will be understood that my invention contemplates any sort of a separated relationship between the upper end of the skirt and the adjacent head 2 because of which heat will not be transmitted efficiently or readily per E from the head to the skirt other than through a connector or connectors which join those two parts of the piston together. It will be understood that this relationship might be that of a poor mechanical fit or joint which would be a poor conductor of heat, as compared with the metal of the head 2 and connectors 3, so that such heat as did pass from the head 2 to the skirt 1 would do so principally by way of the connectors 3, rather than from the head to the upper end of the skirt 1 directly.

A piston of my improved construction may be made unusually light, durable and efficient by forming it of an integral casting of a metallic alloy having a relatively

low specific gravity, such for example as an alloy of aluminum, copper and magnesium, or any other
per C metallic alloy of aluminum **or other low specific gravity metal** known by those skilled in the art to be suitable for the construction of cast, skirted pistons. As the alloys of metals of relatively low specific gravity, suitable for such purposes, have relatively high coef-

—5— 8B

ficients of expansion, some difficulty has been
per D experienced with the use of pistons made ~~by~~ of them in internal combustion motors, due to the necessary clearance between the piston walls and the cylinder walls to allow for such expansion; as the result of which clearance, both "piston slapping" and "oil pumping" are likely to result, as is well known to those skilled in the art. Furthermore, liquid hydro-carbons are likely to escape past the piston into the crank case and thin down the lubricant below to an undesirable degree.

It will be understood that with a piston constructed in accordance with my invention, the sleeve or skirt 1 may be constructed so as relatively snugly to fit the inner walls of the motor cylinder, whereas the head 2 may be given a considerable amount of clearance be-
per A tween its outer ~~periphery~~ **surface** and the inner wall of the cylinder to allow for all necessary expansion of the head due to the high temperatures to which it is directly subjected. The fit between the skirt and the inner wall of the cylinder may be a snug sliding fit and the area of the skirt which co-acts with the inner wall of the cylinder be such as to insure against slapping or rapping of the piston against the inner wall of the cylinder. In fact objectionable piston slap, incident to the operation of numerous types of pistons, for use in internal combustion motors, substantially is eliminated, by the use of a piston constructed in accordance with my invention. Likewise oil pumping is substantially eliminated and the passage of liquid hydro-carbons from the top of the piston to the crank case is practically eliminated, resulting in minimizing of undue and trouble-

—6— 9B

some carbonization and undesirable smoking, among other things.

Due to the fact that the skirt or sleeve 1 is maintained relatively cool under all normal conditions, the

possibilities of scoring of the inner walls of the cylinder are practically eliminated.

The construction of a piston embodying my improvements, as hereinbefore described, may be readily carried out in permanent molds, which is not true of the construction illustrated in said Letters Patent No. 1,092,870, and I have had in mind the use of such permanent molds in the design of my said improvements.

The exterior walls of the skirt near the upper end thereof, where the connectors 3 join the skirt, may be relieved or recessed, as indicated at 1d, to allow for greater expansion at these points than will occur at other points in the same circumference of the skirt.

In the modification of my invention, illustrated in Figs. 5 to 7, inclusive, the lower piston ring groove is formed by the walls of a recess in the peripheral flange 2a of the piston head 2 and the upper end wall of the skirt 1. In this case the lower piston ring 5 may be used as and will operate as an oil wiper and will permit the oil to pass underneath it through the grooves 1e in the upper end wall of the skirt 1 and back into the crank case, thus assisting in keeping the motor from smoking. Where the piston rings are mounted as illustrated in

Figs. 1 and 2, the air gap between the upper end of the skirt and the adjacent wall of the peripheral flange of the piston head will serve to provide an escape for oil back to the crank case from the cylinder walls and substantially eliminate undesirable smoking of the motor.

In the modified construction illustrated in Figs. 10 to 14, inclusive, all of the columns or connectors 3 are disposed out of alignment with the wrist pin bosses 1a. When thus disposed the amount of heat transmitted through such connectors to the wrist pin bosses will be somewhat reduced over that of a piston having the construction illustrated in Figs. 1 to 4, inclusive, as none of such connectors will transmit heat directly to either of the wrist pin bosses, there being a section of skirt between the connection of the lower end of each such connector with the skirt and the connection of the adjacent wrist pin boss with the skirt. Furthermore, with this last referred to modification the relief spaces or recesses in the outer wall of the piston adjacent the points at which the connectors 3 join the skirt will be so disposed as not to reduce any of the principal wearing surfaces of the piston against the inner wall of the cylinder.

Insert C^1

It will be noted that pistons embodying my improvements may be made relatively light in weight, which is of material advantage in assisting in reducing the weight of the reciprocating parts of the motor.

—8— 11B

Pistons of my improved construction will be found to operate comparatively noiselessly, smoothly and efficiently within the cylinders of internal combustion motors and with greatly reduced skirt clearances over ordinary constructions of skirted pistons.

Insert D^2 ~~In my improved process of making a piston for an internal combustion motor the~~ casting may be formed in any suitable mold as a cup-shaped article, as indicated in Fig. 8. Then the outer surface of such casting may be suitably machined or ground so as to have the general external dimensions illustrated ~~in Fig. 9 and thereafter~~ the head 2, including end wall 2' and peripheral wall 2a may be separated from the skirt 1 by inserting a cutting tool at 7, so as to form the air gap between the lower end wall of the peripheral flange 2a of the head and the upper end wall of the skirt. This separation of the head from the skirt may be effected before externally surfacing the casting, if desired. Any well known type of cutting mechanism may be employed for the purpose. After the cut is made the exterior of the casting will have the general appearance illustrated in Fig. 9.

Sub C^2

To those skilled in the art of making mechanism of the class described, many alterations in construction and widely differing embodiments of my application will suggest themselves without departing from the spirit and scope thereof. My disclosures and the description herein are purely illustrative and are not intended to be in any sense limiting.

—9— 12B

What I Claim Is:

1. A piston for an internal combustion motor, comprising a skirt section having a pair of diametrically opposed wrist pin bosses integrally formed with the skirt and extending inwardly from the inner wall thereof, a head having end and peripheral walls, the lower edge of the latter being spaced from the upper edge of the skirt section by an air gap, and means extending from said end wall of said head

Sub. C^3

per A across said air gap to **the most closely adjacent portions of** said skirt section and connecting said parts together.

2. A piston for an internal combustion motor, comprising a skirt section having a pair of diametrically opposed wrist pin bosses integrally formed with the skirt and extending inwardly from the inner wall thereof, a head having end and peripheral walls, the lower edge of the latter being spaced from the upper edge of the skirt section by an air gap, and means integrally formed with the end wall of said head and said skirt section
per A and extending across said air gap ~~for~~ **and** connecting **the most closely adjacent portions of** said parts together.

3. A piston for an internal combustion motor, comprising a skirt section having a pair of diametrically opposed wrist pin bosses integrally formed with the skirt and extending inwardly from the inner wall thereof, a head having end and peripheral walls, the lower edge of the latter being spaced from the upper edge of the skirt section by an air gap, and means disposed out of align-

13B

ment with said wrist pin bosses and extending across said air gap for connecting the end wall of said head and skirt section together.

4. A piston for an internal combustion motor, comprising a skirt section having a pair of diametrically opposed wrist pin bosses integrally formed with the skirt and extending inwardly from the inner wall thereof, a head having end and peripheral walls, the lower edge of the latter being spaced from the upper edge of the skirt section by an air gap, and means integrally formed with said end wall and skirt section and extend-
per A ing across said air gap ~~for~~ **and** connecting **the most closely adjacent portions of** said head and skirt section together.

5. A piston for an internal combustion motor, comprising a skirt section having a pair of diametrically opposed wrist pin bosses integrally formed with the skirt and extending inwardly from the inner wall thereof, a head having end and peripheral walls, the lower edge of the latter being spaced from the upper edge of the skirt section by an air gap, and columns between the head and skirt section formed integrally therewith and disposed out of longitudinal alignment with the wrist pin bosses.

6. A piston for an internal combustion motor, comprising a skirt section having a pair of diametrically opposed wrist pin bosses integrally formed with the skirt and extending inwardly from the inner wall thereof, a head having end and peripheral walls, the lower edge of the latter being spaced from the upper edge of the

14B

skirt section by an air gap, and connectors extending from said peripheral wall downwardly and connecting **it to the inner surface of the inner circumferential wall of** said skirt.

per A

7. A piston for an internal combustion motor, comprising a skirt section having a pair of diametrically opposed wrist pin bosses integrally formed with the skirt and extending inwardly from the inner wall thereof, a head having end and peripheral walls, the lower edge of the latter being spaced from the upper edge of the skirt section by an air gap, and connectors extending from the ~~outer~~ **inner** peripheral walls of said head and connecting said head with **the inner peripheral wall of** said skirt and being integrally formed with said head and skirt.

per A " "

8. A piston for an internal combustion motor, comprising a skirt section having a pair of diametrically opposed wrist pin bosses integrally formed with the skirt and extending inwardly from the inner wall thereof, a head having an inner wall spaced from the adjacent upper edge of the skirt section by a relatively narrow air gap, and connectors connecting said head with **the inner peripheral wall of** said skirt.

per A

9. A piston for an internal combustion motor, comprising a skirt section having a pair of diametrically opposed wrist pin bosses integrally formed with the skirt and extending inwardly from the inner wall thereof, a head having an inner wall spaced from the adjacent upper edge of the skirt section by a relatively narrow air gap, and connectors connecting said head with **the inner peripheral wall of** said skirt and integrally formed with said head and skirt section.

per A

15B

10. A piston for an internal combustion motor comprising a head, a skirt section, there being an air gap between the upper edge of said skirt and the adjacent wall of said head and a piston ring receiving groove formed by the upper edge of said skirt and a recess in

said head, and means connecting said skirt to said head across said air gap.

11. A piston for an internal combustion motor comprising a head, a skirt section, there being an air gap between the upper edge of said skirt and the adjacent wall of said head and a piston ring receiving groove formed by the upper edge of said skirt and a recess in said head, means connecting said skirt to said head across said air gap, and a piston ring in said groove.

per B 12. A piston for an internal combustion motor comprising a head, a skirt section, there being an air gap between the upper edge of said skirt and the adjacent wall of said head and a piston ring receiving groove formed by the upper edge of said skirt and a recess in said head, means connecting said skirt to said head across said air gap, and a piston ring in said groove, there being an oil groove in the upper edge of said skirt beneath said piston ring.

per A 13. The process of making a piston for an internal combustion motor, which consists in forming a cup-shaped casting having a pair of diametrically opposed bosses extending inwardly from

16B

the inside wall of its cylindrical section and a plurality of connectors, each connector extending from the inside of the end wall of said casting a distance therefrom and having its lower end connected with said inside wall of said cylindrical section, and then separating the end wall and a portion of said cylindrical section from the remainder of the cylindrical section by cutting through said cylindrical section between the points at which the ends of said connectors are connected with the casting.

14. The process of making a piston for an internal combustion motor, which consists in forming a cup-shaped casting having a pair of diametrically opposed bosses extending inwardly from the inside wall of its cylindrical section and a plurality of connectors, each connector extending from the inside of the end wall of said casting a distance therefrom and having its lower end connected with said inside wall of said cylindrical section at a point out of alignment with said inwardly extending bosses, and then cutting an opening through said cylindrical section above said wrist pin bosses and between the ends of said connectors.

Application of
Louis P. Mooers
"Piston for Internal Combustion Motor and Process of Making the Same.
Filed June 2, 1917

Hon. Commissioner of Patents:

Sir:

The attention of the Examiner to whom this application which is herewith submitted, is assigned, is respectfully called to the fact that this application contains subject matter which interferes with an application filed by Edward O. Spillman now pending in the Office, and an interference is accordingly requested.

Respectfully Submitted,

LOUIS P. MOOERS,
by HAYNER H. GORDON,
his attorney.

~~THOMAS E. ROBERTSON,~~
Thomas Ewing,
Commissioner of Patents.

This case has been examined.

Page 3, line 7, "Fig. 12" should be —*Fig. 11*—.

Page 6, line 15, change "periphery" to —*surface*—.

Claims 3 and 5 are specific to the modification shown in Figs. 10 to 14, inclusive, whereas claims 10, 11 and 12 are specific to Figs, 5, 6 and 7.

Election of species is required.

Claims 1, 2, 4, 6, 7, 8 and 9 are rejected on the French patent to

Chenard, *et al.*, 468,595, Apr. 28, 1914, 121-104.

Claims 13 and 14 are improper process claims.

They merely define a structure clearly met by the French patent above cited.

The patents to

Franquist, 1,153,902, Sept. 21, 1915, 74-85; and

Spillman, 1,229,540, June 12, 1917, " " ;

are made of record.

Hon. Commissioner of Patents,
Washington, D. C.

Sir:

In the matter of the application of Louis P. Mooers, Ser. No. 172,380, filed June 2, 1917, for Piston for Internal Combustion Motor and Process of Making the Same.

Replying to Office Action dated July 20, 1917:

Page 3, line 7, change the character "12" to —*11*—.

Page 6, line 15, change the word "periphery" to —*surface*—.

Claim 1, next to the last line, after the word "to" insert the words —*the most closely adjacent portions of*—.

Claim 2, next to the last line, cancel the word "for" and insert the word —*and*—; same line, after the word "connecting" insert the words —*the most closely adjacent portions of*—.

Claim 4, last line, cancel the word "for" and insert the word —*and*—; same line, after the word "connecting" insert the words —*the most closely adjacent portions of*—.

Claim 6, last line, after the word "connecting" insert the words —*it to the inner surface of the inner circumferential wall of*—.

Claim 7, line 7, change the word "outer" to —*inner*—; line 8, change the word "walls" to —*wall*—; same line, after the word "with" insert the words —*the inner peripheral wall of*—.

—1— 21B

Claim 8, last line, after the word "with" insert the words —*the inner peripheral wall of*—.

Claim 9, next to the last line, after the word "with" insert the words —*the inner peripheral wall of*—.

Cancel claims 13 and 14.

A reconsideration of the claims as amended is respectfully requested. The importance of what may appear to be relatively slight differences in piston construction is now fully recognized by the most advanced thermodynamics. In fact, some of the principal efficiencies recently attained in the operation of internal combustion engines have been largely due to piston construction.

The Chenard, et al. patent of reference discloses a construction in which the webs d are connected to the inner ends of the wrist pin bosses and not to the inner peripheral wall of the skirt. The disadvantage of the French patented construction lies in that substantially all of the heat from the head which is conducted by means of the webs d will be delivered to the wrist pin bosses, and not evenly distributed at that. This is an objection which applicant's construction avoids and was intended to avoid. Again, the core material and construction required in order to produce the Chenard et al. piston is distinctly more complicated than that required to produce applicant's. The amendments to the claims patentably distinguish the subject-matter.

With reference to claims 3 and 5, attention is directed to the fact that they are the only species of connector location claimed. Division should not be requested under these circumstances.

—2— 22B

Claims 10, 11 and 12, on the other hand, relate to a species of piston ring groove construction and not to

connectors. They are the only species presented relative to any piston ring groove construction. The connector construction is applicable to either ring groove construction. It is believed that all of the claims as presented are properly presented in one application. A reconsideration on this point is respectfully asked.

It is not understood that the specification of the French patent discloses the process called for in claims 13 and 14. As such subject-matter is undoubtedly divisional, the claims have been cancelled, the rights of the applicant being reserved.

The specification was originally drawn with the Franquist and Spillman patented constructions in mind and the claims are believed to be clearly differentiated patentably therefrom.

Respectfully submitted,

LOUIS P. MOOERS,

By HAYNER H. GORDON,

Attorney.

Cleveland, Ohio.

~~THOMAS E. ROBERTSON,~~
James T. Newton,
Commissioner of Patents.

This case has been considered in view of the amendment of July 10, 1918.

Claims 1, 2, 4, 6, 7, 8, 9, 10 and 11 are rejected on patent to Riedler 1,259,292 Mar. 12, 1918 (X74-85)

Claim 12 is rejected on patent to Riedler, supra in view of oil groove shown in patent to Franquist of record or to

Rohn 1,232,846 July 10, 1917 (X74-85)

According to the decision in Ex parte Welch 93 O. G. 2104 all claims should be readable on a single modification.

To conform to this ruling the drawings on sheet 2 should be corrected so that the columns "3" of Figure 5 to 9 would be shifted so as to be out of alignment with the pin bosses such as shown in Figures 10 to 14.

After this correction is made all the claims will be readable on Figures 5 to 9.

B
and
Affidavit

Hon. Commissioner of Patents,
Washington, D. C.

Sir:

In the matter of the application of Louis B. Mooers, for Piston for Internal Combustion Motor and Process of Making Same, filed June 2, 1917, Ser. No. 172,380:

B

Replying to Office action of September 28, 1918:

The patent to Riedler has been carefully considered. It is submitted that the construction therein shown is not comprehensive of the subject-matter of the claims. As we interpret the Riedler construction it is merely a trunk piston with two holes e through it. The lower edge of the head is not spaced from the upper edge of the skirt by an air gap in the sense specified in the rejected claim. The side elevations of the walls of the aperture indicated that

the skirt is indented and not that there is a distinct air gap between the upper edge of the skirt and the lower end of the head section with means extending from the *end wall* or head for connecting the head to the skirt and conducting heat from the head across the air gap to the skirt. However, applicant's invention was made prior to the filing date of the Riedler application in the United States. Riedler does not claim applicant's invention and if Riedler has a corresponding German patent, it cannot be taken advantage of in the present instance to carry back Riedler's date with respect to subject-matter not claimed by him.

—1— 24B

Applicant files herewith an affidavit under Rule 75 carrying his date of invention back of the filing date of the Riedler patent and respectfully requests the reconsideration of claims 1, 2, 4, 6, 7, 8, 9, 10 and 11.

Cancel claim 12.

As to the requirement for correction to Figures 5 to 9 of the drawings, it is respectfully requested that this objection be not insisted upon at the present stage of the prosecution, but only after the scope of allowable claims is conclusively established.

Respectfully submitted,

LOUIS P. MOOERS,
By HAYNER H. GORDON,
Attorney.

Washington, D. C.
September 26, 1919.

—2— 25B

Louis P. Mooers,
Piston for Internal Combustion Motor and Process of Making the Same,
Filed June 2, 1917,
Ser. No. 172,380.

OATH

STATE OF OHIO }
COUNTY OF CUYAHOGA } ss.

LOUIS P. MOOERS, being duly sworn, deposes and says that he is the Louis P. Mooers who filed the above entitled application relating to Piston for Internal Combustion Motor; that he is a citizen of the United States and resident of Cincinnati in the County of Hamilton and

State of Ohio; that he verily believes himself to be the original, first and sole inventor of the improvement in Piston for Internal Combustion Motor shown and described in the above entitled application;

That the subject-matter set forth in claims 1, 2, 4, 6, 7, 8, 9, 10 and 11 was a part of his invention and was invented by him prior to the 31st day of January, 1917; that prior to the 31st day of January, 1917, he fully disclosed his said invention to E. E. Allyne, of Cleveland, Ohio, and others; that prior to January 31st, 1917, at the request of the said E. E. Allyne, he made full-sized working drawings of the said invention and sent the same from Cincinnati, Ohio, to the said E. E. Allyne at Cleveland, Ohio; that the photostat copy hereto attached, made a part hereof and marked "Exhibit A," is a photograph of the said drawings; that owing to conditions entirely beyond affiant's control, namely, those existing during

and imposed by the war, affiant was unable to produce pistons embodying his idea, it being essential that they should be made out of aluminum and the plant in which the said E. E. Allyne was interested, where such pistons could be made, being wholly engaged in war work; that applicant made the invention at the request of the said E. E. Allyne for a piston which could be made of aluminum in a so-called permanent mold and that the said E. E. Allyne was president of the only Company in this country, within applicant's knowledge, where such molds were made; that with all reasonable dispatch after the armistice the said E. E. Allyne had pistons embodying applicant's said invention made and successfully tested at Cleveland, Ohio, and that affiant took all reasonable steps, under existing circumstances, to demonstrate the practicability of his idea and to reduce the same to practice; that the war conditions with which he had to contend prior to June 2, 1917, the date of the filing of his application, were such as to preclude earlier reduction to practice of his invention.

LOUIS P. MOOERS.

Sworn to and subscribed before me, a Notary Public, at Cleveland, County of Cuyahoga and State of Ohio, this 15th day of September, 1919.

Please find below a communication from the EXAMINER in charge of the application of Louis P. Mooers, Filed June 2, 1917, Serial No. 172,380, Piston For Internal Combustion Motor & Process of Making the Same.

~~THOMAS E. ROBERTSON,~~
James T. Newton
Commissioner of Patents.

Responsive to the amendment of Sept. 26, 1919.

The affidavit under Rule 75 has been disapproved by the Law Examiner for it "fails to make the averments specified in the last ten lines of the rule. If applicant will file a supplemental oath making these averments the affidavit will be approved."

Applicant should restrict the title of his invention to the article as he has already cancelled the process claims.

Claim 1 is rejected upon the German patent to

Czermak, 67,264, June 14, 1892 (1 sheet) (74-108)

Claims 2 to 9 inclusive are rejected upon the French patent to

Delaunay, 480,644, Jan. 10, 1916 (2 sheets) (74-108)

Claims 10 and 11 are allowable over the above references but are again rejected upon the patent to Riedler, of record.

P. P. PIERCE,
Examiner.

C &
Affidavit

ent
Cls

IN THE UNITED STATES PATENT OFFICE

In re application of
Louis P. Mooers,
PISTON FOR INTERNAL COMBUSTION MOTOR AND PROCESS OF MAKING SAME
Serial No. 172,380,
Filed June 2, 1917.

Division 12
Room 322.

Hon. Commissioner of Patents,

Sir:

C In response to the Office action of January 6, 1920, applicant amends as follows:

In the petition and in the preamble to the specification, amend the title of the invention by striking out the words "and Process of Making the Same."

Page 4, next to last line, change "convection" to —*conduction*—.

Page 5, line 4 from the bottom, after "aluminum" insert —*or other low specific gravity metal*—.

Page 8, after the paragraph ending in line 5 from the bottom, insert the following:

—In addition, with all the connectors 3 disposed in the regions of the pin bosses, as disclosed in Figs. 10 to 14, inclusive, the piston is especially well adapted to run with a close fit of the guide section 1 in the

C^1 cylinder. It will be observed, on reference to Figs. 10, 13 and 14, that said guide section has a circumferential zone or belt extending from its upper end down to and below the pin boss openings that is characterized by a short outer diameter in line with the bosses and a long

outer diameter at right angles to said bosses, this being due to the above described relief of the piston adjacent the bosses and the connectors 3. Thus when this top

zone of the guide heats up the resulting expansion can be accommodated by outward movement of the relieved part of the wall and danger of seizing, as a result of close engagement between the unrelieved part of said wall and the cylinder, is obviated. This action, of course, is made possible by the fact that the upper end of the guide section is not continuously joined to the head section but, being separated from the head by the air gap, is free to take form in a measure independent of the head. The bottom part of the guide section does not attain so high a temperature as said upper zone so that no special provision for the expansion of said lower part is required.—

Page 9, in lines 9, 10 and 11, strike out "Then the outer surface of such casting may be suitably machined or ground so as to have the general external dimensions illustrated in Fig. 9 and thereafter" and insert in lieu thereof the following:

—While the invention is not limited to any particular method of casting it is to be observed that the improved construction is especially well adapted for casting in a permanent mold, the form and arrangement of the connectors 3 relative to the inner piston walls and the absence of any obstruction that would prevent free access to said inner walls from the open end of the piston, obviating all difficulties incident to coring. The casting being made, its outer surface may be suitably machined or ground so as to have the general ex-

C²

—2— 31B

ternal form illustrated in Fig. 9, or in Figs. 10, 13 and 14, and thereafter—.

Cancel the present claims, Nos. 1 to 11, inclusive, and insert in lieu thereof the following:

—1. An integrally cast piston comprising a head section having end and peripheral walls, a guide section separated at its upper edge from the lower end of the peripheral wall of said head section by an air gap and provided with diametrically opposite wrist pin bosses, and section connectors which spring from the inner surface of the peripheral wall of the head section across said air gap to the upper part of the guide section in the regions of said wrist pin bosses, ~~the interior surface of the head and~~

C³

per D

Insert D^3 ~~guide sections being freely accessible from the open end of the piston.~~

2. An integrally cast piston comprising a head section having end and peripheral walls, a guide section separated at its upper edge from the lower end of the peripheral wall of said head section by an air gap and provided with diametrically opposite wrist pin bosses, and section connectors which spring from the inner surface of the peripheral wall of the head section across said air gap to the upper part of the guide section in the regions of said wrist pin bosses, the wall of said guide section being exteriorly relieved opposite said connectors. per D

3. A piston comprising a head section having end and peripheral walls, a guide section provided with diametrically opposite wrist pin bosses, and means connect-

ing the head and guide sections in the regions of said bosses, the upper edge of the guide section and the lower edge of the head being separated by an air gap in the regions between said connecting means, and the guide section being exteriorly relieved in the regions of the bosses and connecting means. per D

4. An integrally cast piston comprising a head section having end and peripheral walls, a guide section provided with diametrically opposite wrist pin bosses, and means connecting the head and guide sections in the regions of said bosses, the upper edge of the guide section and the lower edge of the head being separated by an air gap in the regions between said connecting means and the guide section being exteriorly relieved in the regions of the bosses and connecting means.

5. A piston for an internal combustion engine comprising a guide section having a pair of diametrically opposed wrist pin bosses integrally formed therewith, a head having end and peripheral walls the lower edge of the latter being spaced from the upper edge of said guide section by a practically continuous non-conducting air gap, and connectors which extend from said peripheral walls downwardly to said guide section and are integrally formed with said peripheral wall and guide section, said guide section being exteriorly relieved in the regions of said connecting means. per D

6. An integral cast piston for an internal combustion engine comprising a guide section having a pair of diametrically opposed wrist pin bosses, a head section having end and peripheral walls, the lower edge of the latter being separated from the upper edge of said guide section by a relatively narrow air gap extending practically around the piston, and connectors which spring from said peripheral wall of said head and the upper end of said guide section and bridge said air gap, D^4 said guide section being exteriorly relieved in the regions of said connecting means.

Insert D^4

7. An integral cast piston for an internal combustion engine comprising a guide section having a pair of diametrically opposed wrist pin bosses, a head section having end and peripheral walls, the lower edge of the latter being separated from the upper edge of said guide section by a relatively narrow air gap extending practically around the piston, and connectors which spring from said peripheral wall of said head and the upper end of said guide section in the regions of said wrist pin bosses and bridge said air gap, said guide section being exteriorly ~~relieved in ever-continuous areas embracing the regions of said bosses and connecting means.~~

per D
Insert E^1

8. A piston for an internal combustion motor, comprising a ~~skirt~~ **guide** section having a pair of diametrically opposed wrist pin bosses integrally formed with the ~~skirt and extending inwardly from the inner wall thereof,~~ **guide section** a head having end and peripheral walls, the lower edge of the latter being ~~spaced~~ **separated** from the upper edge of the ~~skirt~~ **guide** section by an air gap, and means disposed out of alignment with the axes of said wrist pin

per E

per E rated from the upper edge of the ~~skirt~~ guide section by an air gap, and ~~columns between the~~ Sub. E^2 ~~head and skirt guide section formed integrally~~ per D ~~therewith disposed out of longitudinal alignment with the axes of the wrist pin bosses~~, and providing the sole means of connection between said head and guide section.—

Insert E^3 Applicant files herewith a supplemental affidavit which is believed to meet the requirements noted in the last Office letter.

The claims have been carefully rewritten in view of the Examiner's citations and the conference had and are believed to now clearly distinguish from the prior art, the marked differences between applicant's piston and those disclosed in the patents cited being, of course, quite obvious. These differences, in the case of the French patent No. 480,644, upon which the Examiner principally relied, are distinctly notable. Applicant's piston is especially adapted to be made of aluminum or other light alloys and to be cast in a permanent mold. In permanent mold work, of course, the problem of coring is of vital importance. Obviously it would be

quite impossible to cast the Delaunay piston in a permanent mold. In applicant's piston the connectors 3 spring from the inner surfaces of the side walls of the head and the guide and the interior surfaces of the piston are freely accessible from the open end of the piston so that the piston can be cast in permanent mold practically as easily as the standard form of trunk piston. These features are believed to be clearly brought out in claim one The Delaunay piston is clearly a piston developed for the function of controlling the flow of gases to the combustion chamber. It is not of the same type or character as applicant's, which as stated in the specification, is an improvement on pistons of the character disclosed in Spillman & Mooers patent No. 1,092,870. The problem has been with the introduction of aluminum alloys to conserve the metal in piston manufacture as much as possible and to produce a piston which is peculiarly adapted to fulfill in an advantageous manner the various requirements made of it in an internal combustion engine. Where volume production is taken into consideration and efficiency and economy of manufacture becomes an absolute necessity, it will be found that applicant's invention

herein claimed has distinct advantages over any constructions of reference and any of which applicant has knowledge. The difficulty in producing a commercially satisfactory piston, particularly of an aluminum alloy, is widely known in the engineering profession. The problem has been one of the most serious confronting automotive engineers for some years. The simple solution which applicant has hit upon in this invention has proven its commercial merit and it is believed that the claims patentably distinguish from the references without any

question of a doubt.

Claim 2 specifies the relation of the connectors to the head and guide sections and also the relief of the guide sections adjacent the connectors.

The significance of claims 3 to 7, inclusive, will readily be understood from a reading of the explanatory statement inserted on page 8 of the specification.

Claims 8 and 9 specifically set forth that the connectors are not in alignment with the wrist pin bosses and form the sole connections between the parts.

Respectfully submitted,

LOUIS P. MOOERS,

DEPARTMENT OF THE INTERIOR
UNITED STATES PATENT OFFICE

WASHINGTON Mar. 3, 1921
MAILED " " "

Hayner H. Gordon,
Ouray Bldg.,
City.

Please find below a communication from the Examiner in charge of the application of Louis P. Mooers, Filed June 2, 1917, Serial No. 172,380, PISTON FOR INTERNAL COMBUSTION MOTOR.

~~THOMAS E. ROBERTSON,~~
M. H. Coulston,
Acting Commissioner of Patents.

Responsive to the amendment of Jan. 4, 1921.

Claim 1 is rejected upon the French patent to Chenard, of record.

Claim 2 is allowed.

Claims 3, 5, 6 and 7 are rejected as unpatentable over allowed claim 2 in view of either

Mort, 1,257,098, Feb. 19, 1918 (74-108) or the structure appearing in the Automobile Trade Journal, for April, 1916, Page 133, published by the Chilton Publishing Co., Philadelphia, Pa.

Claims 4, 8 and 9 appear allowable as at present advised.

P. P. PIERCE,
Examiner.

Application of
Louis P. Mooers,
Piston for Internal Combustion Motor
and Process of Making Same,
Filed June 2, 1917,
Serial No. 172,380.

ent. Cls.

Hon. Commissioner of Patents,
Washington, D. C.

Sir:

Responding to the Office letter of March 3, 1921, applicant amends as follows:

D

Page 1 of the specification, strike out lines 1, 2 and 3 and insert in lieu thereof the following:

D¹ —*The invention relates to improvements in pistons which are adapted especially for use in internal combustion motors.*—

Page 6, line 2, change "by" to —*of*—.

Page 9, lines 6 and 7, strike out "In my improved process of making a piston for an internal combustion motor the" and insert the following:

D² —*In making my improved piston, I prefer to employ the following process. The*—.

Claim 1, line 8, change "region" to —*regions*—.

Same claim, lines 9 and 10, strike out "the interior surface of the head and guide sections being freely accessible from the open end of the piston" and insert in lieu thereof

D³ —*there being no cored-out space between any of said connectors and the adjacent side walls of the head and guide sections*—.

Claim 2, line 8, change "region" to —*regions*—.

Claim 3, line 7, after "means" insert a comma.

Claim 5, line 7, change "walls" to —*wall*—.

Claim 6, line 9, after the comma insert

D⁴ —*there being no cored-out space between any of said con-*

nectors and the adjacent side walls of the head and guide sections and—.

Claim 7, line 11, strike out "in" and insert —*over continuous areas embracing*—.

Claim 8, line 7, after "with" insert —*the axes of*—.

Claim 9, line 9, before "wrist" insert —*axes of the*—.

The foregoing amendments are made pursuant to the oral interview with the Primary Examiner or May 10, 1921.

It is believed that claim 1 is now quite clearly and patentably distinguished from the French patent to Chenard.

Obviously, the piston shown in said French patent could not be produced in a permanent mold, while applicant's piston, as defined in claim 1, is very readily cast in a permanent mold.

Claims 3, 5, 6 and 7 are understood to have been rejected in the last Office action on the theory that they were distinguished from allowed claim 2 only with respect to the relief around the outer ends of the wrist pin bosses, the patent to Mort 1,257,098 and the cut in the Automobile Trade Journal being cited to show this relief feature per se. But, as was pointed out to the Examiner in the oral interview, this holding is not in accordance with the facts. Taking the claims individually, claim 3 differs very substantially in scope from claim 2. The latter claim calls for a continuous air gap and connectors springing from the side walls of the head and guide sections, while in claim 3, the air gap as defined may not be continuous circumferentially, and the connectors may not spring from the side walls. In other words, the relief of the guide section adjacent the boss is not the only and indeed not the main difference between the second and third claims.

Claim 5, similarly, differs from claim 2 in not being limited to connectors that "spring from the inner surface of the peripheral wall of the head section."

In claim 6, the connectors are not defined as in the regions of the bosses, as in claim 2. In addition, this claim is further distinguished by the above amendment.

Claim 7 is very materially distinguished from claim 2 in that the connectors are not defined as springing from the inner side walls of the sections, and also in specifying that the guide section is relieved over continuous areas embracing the regions of the boss and connecting means.

For the reasons above stated, it is believed that each of claims 3, 5, 6 and 7 are properly allowable, as well as

claim 2, and allowance of the application as now presented is respectfully solicited.

Respectfully yours,

Louis P. Mooers,
By Hayner H. Gordon,
Attorney.

DEPARTMENT OF THE INTERIOR
UNITED STATES PATENT OFFICE
WASHINGTON

June 3, 1921

Louis P. Mooers, Assr.

Sir: Your Application for a patent for an Improvement in Pistons For Internal Combustion Motor filed June 2, 1917, has been examined and Allowed.

The final fee, Twenty Dollars, must be paid not later than Six Months from the date of this present notice of allowance. If the final fee be not paid within that period, the patent on this application will be withheld, unless renewed with an additional fee of $15, under the provisions of Section 4897, Revised Statutes.

The office delivers patents upon the day of their date, and on which their term begins to run. The printing, photolithographing, and engrossing of the several patent parts, preparatory to final signing and sealing, will require about four weeks, and such work will not be undertaken until after payment of the necessary fee.

When you send the final fee you will also send, Distinctly and Plainly Written, the name of the Inventor, Title of Invention, and Serial Number as Above Given, Date of Allowance (which is the date of this circular), Date of Filing, and, if assigned, the Names of the Assignees.

If you desire to have the patent issue to ASSIGNEES, an assignment containing a REQUEST to that effect, together with the FEE for recording the same, must be filed in this office on or before the date of payment of final fee.

After issue of the patent uncertified copies of the drawings and specifications may be purchased at the price of TEN CENTS EACH. The money should accompany the order. Postage stamps will not be received.

Final fees will NOT be received from other than the applicant, his assignee or attorney, or a party in interest as shown by the records of the Patent Office.

Respectfully,

THOMAS E. ROBERTSON,
Commissioner of Patents.

HAYNER H. GORDON,
Ouray Bldg.,
City.

☞ IN REMITTING THE FINAL FEE GIVE THE SERIAL NUMBER AT THE HEAD OF THIS NOTICE.

☞ UNCERTIFIED CHECKS WILL NOT BE ACCEPTED.

U. S. Patent Office.

IN THE UNITED STATES PATENT OFFICE

Application of
Louis P. Mooers,

Piston for Internal Combustion Motor
and Process of Making Same,

Filed June 2, 1917
Serial No. 172,380

Amended under Rule 78.

Hon. Commissioner of Patents,
Washington, D. C.

Sir:

In reviewing this application preparatory to the payment of the final fee, a typographical error has been noted in the specification, the use of different terms to refer to the same element has been found to exist in several of the claims and it has been deemed advisable that the patent should issue with several claims for narrower subject matter than called for by certain of the present allowed claims in order fully to protect the inventor.

Furthermore in view of the decision of the Circuit Court of Appeals, Second Circuit, in the case of Geo. Cutter Co. vs. Metropolitan Electric Manufacturing Company reported in volume 275, No. 2 of the Federal Reporter, page 158 published Nov. 17, 1921, it would seem to be incumbent upon every patent solicitor in order to fully protect his client wherever any amendments have been made to the original claims in the course of prosecution of the application and prior to the payment of the final fee, to file a supplemental oath with respect to the claims as finally allowed, as a matter of sheer precaution. Applicant's attorney believes the original oath herein to cover the claims finally allowed but there is no reason he knows of why he should take any chances in this respect and accordingly files herewith a supplemental oath covering the subject matter of the claims as they will issue.

Accordingly please amend as follows:

Page 5, line 10, after the word "skirt" insert the words —*other than*—

This corrects the typographical error above referred to. It is obvious that without these words the sentence does not make sense.

Claim 7, cancel the last line and insert the
E¹ words —*relieved over continuous areas each embracing the region of one of said bosses and the adjacent connecting means*—

The claim without this amendment does not appear to be grammatical.

Claim 8, cancel the word "skirt" in each instance where it appears in lines 2 and 6 and insert the word —*guide*— in each instance in lieu thereof;

Line 3, cancel the word "skirt" and insert the words —*guide section*—

Line 4, cancel from the word "and" through the word "thereof"; line 6, cancel the word "spaced" and insert the word —*separated*—

In this claim 8 in several places an element is referred to as a skirt and in the last line as a guide section. Certainly the same terms should be used to mean the same thing throughout the claim. Again it seems to be better to use the words "separated by an air gap" than "spaced by an air gap." The same corrections are made with respect to claim 9.

Claim 9, cancel the word "skirt" where it appears in lines 2, 6 and 7 and insert the word —*guide*— in each instance in lieu thereof;

Line 3, cancel the word "skirt" and insert the words —*guide section*—

Line 4, cancel from the word "and" through the word "thereof";

Line 6, cancel the word "spaced" and insert the word —*separated*—;

Line 7, cancel from the word "columns" through the word "bosses," line 9 and insert —*connectors between the peripheral wall of said head and the*
E² *guide section formed integral therewith and radially inset with respect to said peripheral wall*—

It is thought that the definition of the disposition of the columns in claim 9 might be misinterpreted as originally expressed but the proposed amendment should clearly avoid any misunderstanding.

Insert the following claims:

—10. An integrally cast piston comprising a head section having end and peripheral walls, a guide section separated at its upper edge from the lower edge of the peripheral wall of said head section by an air gap and provided with diametrically opposed wrist pin bosses and section connectors between the head section and the guide section in the regions of said wrist pin bosses, said connectors being disposed radially inside the air gap and there being no cored-out space between any of said connectors and the adjacent side walls of the head and guide sections.

E^3

11. An integrally cast piston comprising a head section having an end wall and a peripheral wall formed with a plurality of ring grooves, a guide section provided with diametrically opposite wrist pin bosses, and means connecting the head and guide sections in the regions of said bosses, the upper edge of the guide section and the lower edge of the head being separated in the regions between said connecting means by air gaps disposed below the lower-most of said ring grooves and the guide section being exteriorly relieved in the regions of the bosses and connecting means.

12. An integrally cast piston comprising a head section having end and peripheral walls, a guide section

—3— 52B

non-compressible circumferentially and provided with diametrically opposite wrist pin bosses, and means connecting the head and guide sections in the regions of said bosses, the upper edge of the guide section and the lower edge of the head being separated by an air gap in the regions between said connecting means and the guide section being exteriorly relieved in the regions of the bosses and connecting means.—

The three claims herewith submitted are more specific with respect to the subject matter involved than are claims 1, 3 and 4 respectively and they patentably differentiate therefrom. As above suggested, they are believed to be necessary fully to protect applicant's invention.

The review of this application which has been made in conference with the applicant, also has disclosed an inaccuracy in the oaths submitted with the amendments herein dated September 26, 1919 and January 4, 1921 respectively, in that the word "invention" where used in one place in each of said oaths should have been

"design shown by Exhibit A," reference to which is made in the supplemental oath filed herewith.

Respectfully submitted,
LOUIS P. MOOERS,

OATH

DISTRICT OF COLUMBIA, ss:

Louis P. Mooers, being duly sworn, deposes and says that he is the Louis P. Mooers who filed above entitled application for Letters Patent; that the subject matter of each amendment to the said application which has been made, including the amendment dated November 30, 1921, was part of his invention, was invented before he filed his original application, above identified, for such invention; that his invention as set forth in the specification and described and claimed in the twelve claims of the application as amended by the said amendment dated November 30, 1921, was not known or used before his invention or discovery thereof, or patented or described in any printed publication in any country before his invention or discovery thereof or more than two years prior to the original filing of his application above identified, or in public use or on sale in the United States for more than two years prior to the original filing of said application; that said invention has not been patented in any country foreign to the United States on an application filed by him or his legal representatives or assigns more than twelve months prior to this application; that no application for patent on said invention has been filed by him or his representatives or assigns

55B

in any country foreign to the United States; and that said invention has not been abandoned.

Affiant further states that preparatory to paying the final fee in his application above identified, affiant has carefully reviewed the record thereof and has noted in connection with his affidavits filed with the amendments of September 26, 1919 and January 3, 1921, respectively,

an error, namely, that the word "invention" where it appears in line 6, page 2 of the first affidavit and in line 5, page 2, of the second affidavit should have been the words —*design shown by Exhibit A*—; that as a matter of fact affiant made the invention in question long prior to the said request of the said E. E. Allyne; that affiant's attorney who prepared the oaths in question was not aware of this fact and prepared said oaths in ignorance thereof, and that affiant did not note the error until reviewing the records of the application as above stated, and that he now makes oath with respect to said error in order to correct his application record in this respect.

LOUIS P. MOOERS.

PETITION.

To THE COMMISSIONER OF PATENTS:

Your petitioner, FRANK JARDINE, a citizen of the United States and a resident of Cleveland, in the County of Cuyahoga and State of Ohio, whose post-office address is care of The Aluminum Castings Company, Cleveland, Ohio, prays that Letters Patent may be granted to him for the improvement in Pistons, set forth in the annexed specification; and he hereby appoints Ray Stewart Gehr, of 1900 Euclid Building, Cleveland, Ohio, his attorney with full power of substitution and revocation, to prosecute this application, to make alterations and amend-

ments therein, to receive the patent, and to transact all business in the Patent Office connected therewith.

Signed at Cleveland, County of Cuyahoga, State of Ohio, this 9th day of March 1920.

FRANK JARDINE.

SPECIFICATION.

TO ALL WHOM IT MAY CONCERN:

Be it known, that I, Frank Jardine, a citizen of the United States, residing at Cleveland, in the County of Cuyahoga, and State of Ohio, have invented certain new and useful improvements in pistons, of which the following is a specification, reference being had therein to the accompanying drawings.

364997—2

(Hir.) I 885

My invention relates to pistons for internal combustion engines and especially to pistons formed of light weight metals or alloys.

The invention has for its chief object the construction of a light alloy piston which, with relatively small initial clearance, will operate satisfactorily at all temperatures in an engine cylinder.

Another object of the invention is to produce a piston of the character noted that will lend itself to economic methods of manufacture.

Because of the high co-efficient of expansion of suitable light alloys such as aluminum alloys, as compared with iron, it is often difficult to fit an internal combustion engine satisfactorily operable with iron pistons, with light alloy pistons so that such pistons will not be noisy and will not pump oil when cold, or will not stick or score the cylinder wall when heated. I have found that these difficulties can be overcome by constructing a piston with its skirt or guide portion supported and slotted or divided in a manner to permit deformation and deflection of parts thereof without interfering with the performance of the essential functions of the respective parts.

To facilitate an understanding of the invention two forms or embodiments thereof are described hereinafter and are illustrated in the accompanying drawings in which

Fig. 1 is a view partly in side elevation and
per B partly in section of a ~~"slipper" type~~ piston constructed in accordance with my invention.

Fig. 2 is a side elevation of the same piston viewed at right angles to Fig. 1.

Fig. 3 is a section on the line 3—3 of Fig. 1.

Fig. 4 is a section on the line 4—4 of Fig. 1.

364997—3

I 886

Fig. 5 is a section on the line 5—5 of Fig. 1.

Fig. 6 is a view partly in side elevation and
per B partly in section of a ~~"slipper" type~~ piston of modified form.

Fig. 7 is a side elevation of the same viewed at right angles to Fig. 6 and with parts broken away and shown in section.

Fig. 8 is a section on line 8—8 of Fig. 6.

Fig. 9 is a section on line 9—9 of Fig. 6.

Referring first to Figs. 1 to 5, the piston
per B shown ~~is of the so-called slipper type and~~ com-
" B prises a head portion 1 and a guide ~~or skirt~~ portion designated in its entirety by 2. The head portion consists of a head disc 3 and a peripheral flange 4 in which are grooves 4a for the ordinary piston rings 5. On the lower face of the head disc 3 are formed two depending webs 6 integral with the disc. These webs carry bosses 7 which are adapted to receive the ordinary wrist pin. Ribs 8 may be provided along the webs 6 between the head disc and the bosses for strengthening the webs 6 and supporting the inner ends of the bosses. Additional ribs 9 may be formed on the outer sides of webs 6 as shown to strengthen them and to support the outer ends of the bosses.

The guide portion 2 comprises two pairs of
per B ~~slipper~~ guide segments 10 and 10a curved to conform to the engine cylinder, one pair being located on either side of the bosses. The segments are integral with the webs 6 and are supported and connected to the head portion 1 by means of these webs. The segments at their upper ends are separated from the flange 4 of head portion 1 by slots 11 and are further isolated from the head by slots 11a formed in webs 6. The segments of each pair are separated from one another by a longitudinally extending slot 12, said slot preferably being inclined or spirally arranged as shown. In the construc-

364997—4

per B tion shown the guide ~~slipper~~ portion formed by

I 887

segments 10a is designed to take the diagonal thrust of the piston rod during the compression stroke of the engine and as said thrust is less than the corre-
44 sponding thrust during the explosion stroke, said
per B ~~slipper~~ portion 10a is made narrower circumfer-
" B entially than the other ~~slipper~~ portion 10 so as to save weight.

The flange 4 of the head portion 1 has a smaller outer diameter than the guide portion 2, the diameter of the latter being only slightly smaller than the internal diameter of the cylinder in which it is to function.

In the operation of an internal combustion engine the piston usually is heated to a higher temperature than the cylinder wall and expands radially to a greater amount than the cylinder. This expansion reduces the clearance between the piston skirt or guide part and the cylinder wall and in the case of pistons not constructed according to my invention, if the initial clearance provided is small, scoring of the cylinder walls or piston, or seizure of the piston in the cylinder may result. With my invention, however, the guide segments 10, 10a, are capable of deformation or displacement as the piston guide parts expand, the segments being forced toward one another so as to tend to close up the slots 12. The
per B webs 6 and ~~slipper~~ guide segments preferably are so designed that this displacement of the segments 10, 10a, is permitted by virtue of a bending of the
per B webs 6 at points remote from the ~~slipper~~ guide
" B segments. To this end, as shown in Fig. ~~5~~, 4 the
per A thickness of the ~~slipper~~ guide segments is increased toward the webs 6 and the webs 6 are de-
" B creased in thickness from the ~~slippers~~ guide portions inward toward the bosses to points in line with the inner ends of the slots 11a. This gives in effect a cantilever structure weakest at its support,
per A namely, along the dotted lines 13 in Figs. ~~3.~~ 1 and 4 Thus the reaction force of the cylinder wall on the
" B outer faces of the ~~slipper~~ guide segments as the

I 888

piston expands tends to cause bending of the webs 6 along said lines 13. Due to the bending of the web sections 6 and the forcing together of each pair of seg-

ments, the guide part of the piston may undergo a considerable thermal expansion without a corresponding increase in the outer diameter thereof and thus a small initial clearance can be used without danger of scoring or seizure of the piston.

By variation of the thickness and design of the webs 6 and the location of the slots 11a therein, the force necessary to cause the guide segments 10 and 10a to approach one another along the slot 12, or in effect to maintain the outer diameter of the piston substantially constant, can be easily regulated. The webs 6 will tend to bend along a line extending vertically downward from the ends of slots 11a and if said slots are terminated closer to the guide segments 10, 10a the region of bending will be moved outward correspondingly. Likewise a thickening of the webs 6 near the bosses will tend to move the point of bending or flexing closer to the guide segments 10, 10a. An increase of the thickness of the webs 6 obviously will increase the force necessary to cause the guide segments 10, 10a to approach one another along the slot 12.

In Figs. 6 to 9 a modified form of piston is shown. The head portion 21 is formed with a head disc 22 and a depending peripheral flange 23 in which may be formed grooves 24 for the ordinary piston rings. Depending webs 25 are formed at diametrically opposite parts of the lower edge of the peripheral flange 23. These webs carry bosses 26 for the customary wrist pin, the inner ends of the bosses being supported by ribs 27 which join the webs 25 and extend from the inner ends of the bosses 26 to the lower side of the head disc 22, while the outer ends of said bosses are supported by ribs 27a.

On either side of the bosses 26 are formed pairs of guide segments 28 and 28a similar to those shown in

Figs. 1 to 5. These segments are united with webs 25 as shown and are separated from the flange 23 by slots 29 and further isolated from the head by slots 29a in the walls 25. The guide segments of each pair are separated from one another by longitudinally extending slots 30.

It will be seen that this last form of construction is based upon the same principles as the first form and further detailed description is therefore unnecessary. The main difference between the last form of construction and that first described resides in the webs 25 which

support the wrist pin bosses and the guide
per B slippers, portions said walls being joined to the
41 head structure at the lower edge of the ring flange 23 rather than springing from the head disc as in the first form of construction.

From the foregoing description the operation of pistons embodying my improvements will readily be understood. It will be seen that an aluminum alloy piston embodying my invention can be fitted to the engine cylinder with a very small clearance and that compensation for the relatively large thermal expansion of the guide section of the piston is provided by the displacement of the guide segments which results from the reaction force of the cylinder wall on the outer faces of the guides. As above indicated the reaction force necessary to displace the guide parts and effect such compensation can readily be controlled by properly forming and proportioning the guide parts. In this connection it will be obvious to the designer that account must be taken of such factors as compression pressures, piston diameter and piston stroke as determining the lateral thrust to which the guide parts will be subjected. It is obvious that the compensating displacement of the guide parts should require a thrust great enough to insure adequate mechanical strength of the piston and small enough to obviate scoring of the piston and cylinder or seizure of the

piston.

While I have shown my invention applied to the slipper type of piston as distinguished from the skirt type it is to be understood that the invention is essentially applicable to other forms of construction, the scope of the invention being indicated by the appended claims.

What I claim is—(B' Cls. 1-2)

1. In a piston for an internal combustion engine, the combination of a piston head comprising a disc having an integral peripheral flange formed with ring grooves, piston rings in said grooves, two pairs of curved members oppositely disposed with relation to the axis of the piston and together adapted to function as a cylinder-engaging guide, each pair of curved members being separated from the head flange and from each

Per C other by continuous air gaps, two webs which are integral with and spring from the head disc each being connected to and integral with one of the guide members of each of said pairs thereof and constituting the only connection between the face of the piston head disc and the guide members, and wrist pin bosses formed in these webs in which they are so positioned as to lie between the pairs of guide members as set forth.

2. In a piston for an internal combustion engine, the combination of a piston head comprising a disc having an integral peripheral flange formed with ring grooves, two pairs of curved members oppositely disposed with relation to the axis of the piston and together adapted to function as a cylinder-engaging guide, each pair of curved members being separated from the head flange and from each other by continuous air gaps, two webs which are integral with the piston head, each being connected to and integral with one of the guide members of each of said pairs thereof and constituting the only connection between the piston head and the guide members, and wrist pin bosses formed in these webs in which they are so positioned as to lie between the pairs of guide members as set forth.

3. In a piston for an internal combustion engine, the combination of a piston head comprising a disc having an integral peripheral flange formed with ring grooves, two pairs of curved guide members oppositely disposed with relation to the axis of the piston and together adapted to function as a cylinder-engaging guide, the curved members of each pair thereof being separated from the head flange and from each other by continuous air gaps, two webs integral with the piston head and connected to the adjacent guide members, and wrist pin bosses formed in these webs in which they are so positioned as to lie between the pairs of guide members as set forth.

364997—9
I 892

---

4. 1c In a piston for an internal combustion engine, the combination of a piston head having a depending ring flange, two pairs of curved guide members oppositely disposed with relation to the axis of the piston, the curved members of each pair thereof being separated Per A from the ~~head~~ ring flange and from each other

Per G

by continuous air gaps, and webs carrying wrist pin bosses, the said curved members, piston head and webs being united in an integral unitary structure.

Per C

5. In a piston for an internal combustion engine, the combination of a piston head comprising a head disc and a depending peripheral flange formed with ring grooves, and a guide formed integrally with the head and comprising two pairs of cylinder-engaging curved members oppositely disposed with relation to the axis of the piston and two webs each connected to the head and to one of the guide members of each of said pairs thereof, each pair of curved members being separated from the head flange and from each other by continuous air gaps, and wrist pin bosses formed in the webs in which they are so positioned as to lie between the pairs of guide members as set forth, the said guide structure being adapted to permit the curved members of each pair to approach each other under the reaction forces of the cylinder when the piston is heated.

Per H

6. 2c In a piston for an internal combustion engine, the combination of a piston head comprising a head disc and a depending peripheral flange formed with ring grooves, curved guide members separated from the piston head by air gaps, webs in which wrist pin bosses are formed, the curved members, piston head and webs being integrally united and formed in such a manner that the said members on either side of the said bosses may approach each other as the piston expands to maintain substantially constant the diameter of the said curved members when taken together.

364997—10

Per C

7. In a piston for an internal combustion engine, the combination with a piston head comprising a disc and a depending peripheral flange formed with ring grooves, of a guide structure operably connected to the head and comprising two pairs of cylinder-engaging curved parts and two webs each connected to one curved member of each pair and formed with a wrist pin aperture, each pair of curved guide parts being separated from the head flange and from each other by continuous air gaps and the guide structure being

adapted to permit the curved guide members of each pair to approach each other under the reaction forces of the cylinder when the piston is heated.

DEPARTMENT OF THE INTERIOR
UNITED STATES PATENT OFFICE

Washington, Sept. 8, 1920.

Frank Jardine,

Sir: Your Application for a patent for an Improvement in Pistons filed Mar. 1, 1920, has been examined and Allowed.

The final fee, Twenty Dollars, must be paid not later than Six Months from the date of this present notice of allowance. If the final fee be not paid within that period, the patent on this application will be withheld, unless renewed with an additional fee of $15, under the provisions of Section 4897, Revised Statutes.

The office delivers patents upon the day of their date, and on which their term begins to run. The printing, photolithographing, and engrossing of the several patent parts, preparatory to final signing and sealing, will require about four weeks, and such work will not be undertaken until after payment of the necessary fee.

When you send the final fee you will also send, Distinctly and Plainly Written, the name of the Inventor, Title of Invention, and Serial Number as Above Given, Date of Allowance (which is the date of this circular), Date of Filing, and, if assigned, the Names of the Assignees.

If you desire to have the patent issue to Assignees, an assignment containing a Request to that effect, together with the Fee for recording the same, must be filed in this office on or before the date of payment of final fee.

After issue of the patent uncertified copies of the drawings and specifications may be purchased at the price of ~~Five~~ Ten Cents Each. The money should accompany the order. Postage stamps will not be received.

Final fees will Not be received from other than the applicant, his assignee or attorney, or a party in interest as shown by the records of the Patent Office.

Respectfully,

~~James T. Newton,~~

R. F. Whitehead.

Commissioner of Patents.

B. D. Watts,
451 Lennox Bldg., East 9th & Euclid Ave.,
Cleveland, Ohio.

☞ In Remitting the Final Fee Give the Serial Number at the Head of This Notice.

☞ Uncertified Checks Will Not Be Accepted.

RENEWAL PETITION

To the Commissioner of Patents:

Your petitioner, Frank Jardine, a citizen of the United States, and a resident of Cleveland, in the County of Cuyahoga, and State of Ohio, whose post-office address is Care of the Aluminum Castings Company, Cleveland, Ohio, represents that on the 11th day of March 1920, he filed an application for Letters Patent for an improvement in Pistons, Serial No. 364,997 which application was allowed September 8th 1920, but that he failed to make payment of the final fee within the time allowed by law. He now makes renewed application for Letters Patent for said invention, and prays that the original specification, oath and drawings, may be used as a part of this application.

Signed at Cleveland, in the County of Cuyahoga and State of Ohio, this 7 day of March 1921.

FRANK JARDINE,
By B. D. WATTS,
His Attorney.

D. C.

Sir:

Applicant amends the above identified application as follows:

Page 3, line 25 cancel "5" and insert, —4—.

Page 3, next to last line, change "Fig. 3", to —*Figs. 1 and 4*—.

Claim 4, line 5 cancel "head" and insert —*ring*—.

Enter the following claims as claims, 8, 9, 10 and 11.

Sub B' A' 8. —In a piston for an internal combustion engine, the combination of a substantially cylindrical piston head having grooves therein, piston rings in said grooves, a skirt for said piston head connected to the same, piston pin bosses in said piston, the portions of the skirt adjacent the outer ends of the bosses, being relieved all along the length of

the skirt, said piston being provided with horizontal slots adjacent the junction of the head and the skirt and

364997—19

with a vertical, or substantially vertical, slot extending thruout, or substantially thruout, the length of the skirt.

9. —In a piston for an internal combustion engine, the combination of a substantially cylindrical piston head having grooves therein, piston rings in said grooves, a skirt for said piston head connected to the same, piston pin bosses in said piston, the portions of the skirt adjacent the outer ends of the bosses being relieveed all along the length of the skirt, said piston being provided with a vertical, or substantially vertical, slot eextending, from near the junction of the skirt with the head, thruout, or substantially thruout, the length of the skirt to or near the lower end of the skirt.

10. —In a piston for an internal combustion engine, the combination of a substantially cylindrical piston head having grooves therein, piston rings in said grooves, a skirt for said piston head connected to the same, piston pin bosses in said piston, the portions of the skirt adjacent the outer ends of the bosses being relieved all along the length of the skirt, said piston head being provided with circumferential slots adjacent the junction of the head and the skirt, and with a vertical, or substantially vertical, slot, substantially midway between the ends of the piston pin bosses joining one of the horizontal slots at one end and extending thruout, or substantially thruout, the length of the skirt to or near the lower end of the skirt.

11. —In a piston for an internal combustion engine, the coambination of a substantially cylindrical piston head having grooves therein, piston rings in said grooves, a skirt for said piston head connected to the same, piston pin bosses in said piston, portions of the skirt adjacent the outer ends of the bosses being relieveed, said piston beihg provided with cir-

364997—20

cumferential slots adjacent the junction of the head and the skirt, and with a vertical, or substantially vertical, slot substantially midway between the ends of the piston pin bosses, adjoining one of the horizontal slots at one end and extending thruout, or substantially thruout, the length of the skirt to or near the lower end of the skirt.

It is believed that the new claims herewith presented are clearly allowable and early and favorable action is solicited.

Respectfully submitted,

FRANK JARDINE,
By B. D. WATTS,
His Attorney.

DEPARTMENT OF THE INTERIOR
UNITED STATES PATENT OFFICE

Washington Apr. 9, 1921.

B. D. Watts,
451 Lennox Bldg.,
East 9th St. & Euclid Ave.,
Cleveland, Ohio.

Please find below a communication from the Examiner in charge of the application of Frank Jardine, Filed Mar. 9, 1921, Serial No. 450,898 PISTONS.

THOMAS E. ROBERTSON,
Commissioner of Patents.

Responsive to the amendment of Mar. 8, 1921.

Claim 9, line 6 "relieves" should be *relieved*. Line 8 "ectending" should be *extending*.

Claim 11, line 2 "combination" is misspelled. Line 6 "relieves" should be *relieved*.

Claims 8 to 11 inclusive are rejected as defining structure unwarranted by the specification and drawing. The slot 12 is described in the specification and shown on the drawing as being spiral or diagonal. It would therefore be inconsistent to claim a "vertical" slot. Applicant is also unwarranted in claiming horizontal slots extending *"substantially thruout"* the length of the skirt when he only shows a slot extending *thruout*.

The expressions "throughout, or substantially throughout," "vertical or substantially vertical" and

"the length of the skirt to or near the lower end—" are objectionable as being alternative.

The remaining claims stand allowed.

P. P. PIERCE,
Examiner.

January 20, 1922.

Hon. Commissioner of Patents,
Washington,
D. C.

Sir:—

B

Applicant amends the above identified application as follows:—

Page 1, line six from the bottom, cancel "slipper type".

Page 2, line 3, cancel "slipper type".

Page 2, lines 9 and 10, cancel "is of the so-called slipper type and". Page 2, line 11, between "guide" and "portion" insert *or skirt*.

Change "slipper" to *guide* in the following places:—

Page 2, line 22; page 3, line 21; page 3, line 24; page 3, line 25; page 3, last line.

Page 2, last line, change "slipper" to *portion*.

Page 3, line 4, change "slipper" to *portion 10a*. Page 3, line 5, change "slipper" to *portion 10*. Page 3, line 5, from the bottom, change "slippers" to *guide portions*.

Page 5, line 11, change "slippers" to *portions*.

Cancel claims 8 to 11 inclusive and substitute the following:—

~~3c.~~ ~~8.~~ 1. In a piston for an internal combustion
B^1 engine, the combination of a head having ring grooves therein, a plurality of webs integral with said head and having diametrically opposite piston pin bosses therein, a skirt integral with said webs relieved adjacent said webs and separated from the head by cir-

364997—24

I 896

cumferential slots and provided with a longitudinal slot connecting the lower end of the piston with one of the circumferential slots. (over)

~~9.~~ 4c In a piston for an internal combustion engine the combination of a head having ring grooves therein, a plurality of cordal webs integral with said head
Per H and having diametrically opposite piston pin bosses therein, a skirt integral with said webs, relieved adjacent said webs and separated from the head by circumferential slots and provided with a
Per G longitudinal slot ~~connecting~~ lying on a line extending from the lower end of the piston ~~with~~ to one of the circumferential slots.

~~10.~~ 5c In a piston for an internal combustion engine, the combination of a head having ring grooves therein, a plurality of webs integral with the head and extending downwardly therefrom, diametrically opposite piston pin bosses in said webs, a skirt for said piston,
Per G relieved adjacent said webs to expose said bosses, with circumferential slots between said head and skirt, and having a longitudinal slot
" G lying on a line extending from connecting the lower end of the skirt with one of the slots.

11. In a piston for an internal combustion engine the combination of a head having ring grooves therein, a plurality of webs connected to the piston head
Per C and extending downward therefrom, diametrically oppositely disposed wrist pin bosses, one in each of said webs, a skirt for said piston connected to the side edges of the webs and relieved adjacent the webs to expose the webs and the bosses, said piston pro-

vided with circumferential slots between the skirt and head and with a longitudinal slot extending from a circumferential slot to the open end of the skirt.

12. In a piston for an internal combustion engine, the combination of a head, a plurality of webs each connected integrally at one end with the head and projecting downwardly therefrom, and piston pin bosses in each web, a skirt for said piston connected integrally with the

I 897

side edges of the webs and relieved adjacent the webs to expose the webs and the bosses, said piston provided with circumferential slots between the piston head and the piston skirt portion, and with a longitudinal slot extending from the open end of the skirt to one of the circumferential slots.

~~6c 13.~~ 2. In a piston for an internal combustion engine the combination of a head comprising a head disc and a peripheral flange having ring grooves

Per I

therein, a pair of chordal webs, substantially rectangular in shape and located opposite each other in the piston, connected integrally at their upper edges to the peripheral flange of the piston, diametrically opposite wrist pin bosses, one in each of said webs, a skirt for said piston integrally connected to each of the side edges of the webs and cut away so as to expose each of the rectangular webs and the piston pin bosses from the outside of the piston, said piston being provided with circumferential slots between the skirt and head and with a longitudinal slot extending from one of the circumferential slots to the open end of the piston. (C/Cls. 3-12)

~~14.~~ 7c In a piston for an internal combustion engine, the combination of a head provided with **having** ring grooves therein, a pair of webs integral with and dependent from said head and located opposite each other, diametrically oppositely disposed wrist pin bosses, one in each of said webs, a skirt for said piston, in-

Per H

tegrally connected to each of the side edges of the webs, said piston being provided with circumferential slots between the skirt and head and with a longitudinal slot extending from one of the circumferential slots to the open end of the piston.

~~15.~~ 8c In a piston for an internal combustion engine, the combination of a head and a pair of cordal webs sub-

stantially rectangular in shape, located opposite each other in the piston and connected integrally at their upper edges to the piston head, diametrically oppositely disposed wrist pin bosses, one in each of said webs, and

—3— 364997—26

I 898

a skirt for said piston integrally connected to each of the side edges of the webs, said piston being provided with circumferential slots between the skirt and head and with a longitudinal slot extending from one of the circumferential slots to the open end of the piston.

~~16.~~ 9c In a piston for an internal combustion engine, the combination of a head, webs integrally connected to said head and dependent therefrom, oppositely disposed piston pin bosses mounted one in each of said webs and integral therewith, a skirt for said piston integrally connected to each of said webs and extending beyond the same, said piston provided with circumferential slots between the head and skirt and with a longitudinal slot connecting one of said circumferential slots and the open end of the skirt of the piston.

10c ~~17.~~ In a piston for an internal combustion engine, the combination of a head having ring grooves therein, a plurality of cordal webs integrally connected with the piston head and extending downwardly therefrom, oppositely disposed piston pin bosses, integral with said webs and mounted therein, a skirt for said piston longer than said webs and interconnected at the side edges of the webs to each of said webs, said piston being provided with circumferential slots between the head and skirt and with a longitudinal slot connecting one of said circumferential slots with the open end of the skirt.

CUYAHOGA COUNTY } ss.

Frank Jardine, whose application for Letters Patent for an improvement in PISTONS, serial No. 364,997, was filed in the United States Patent Office on or about March 11th, 1920, being duly sworn deposes and says that the subject matter of the foregoing amendment attached hereto and containing new claims 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, was part of his invention, was invented before he filed his original application above identified for such invention, was not known or used before his invention, was not patented or described in a printed publication in any country more than two years before his application, was not patented in a foreign country on an application filed by himself or his legal representatives or assigns more than twelve months before his application, was not in public use or on sale in this country for more than two years before the date of his application, and has not been abandoned.

FRANK JARDINE.

Sworn to before me and signed in my presence this 16th day of January, 1922.

MERLE B. PRICE,
Notary Public.

Please find below a communication from the EXAMINER in charge of the application of Frank Jardine, Filed Mar. 9, 1921, Serial No. 450,898, PISTONS.

THOMAS E. ROBERTSON,
Commissioner of Patents.

Responsive to the amendment of Jan. 23, 1922.

Claims 1, 2 and 3 are rejected as being unpatentable over Claim 4 in view of

Ricardo, 1,294,833, Feb. 18, 1919 (74-108)

Claims 5, 6 and 7 are rejected as being substantially duplicates of each other. Applicant may select either one of these claims that he desires.

Claims 9 to 17 inclusive are rejected as being unpatentable over claim 8 in view of Ricardo, supra. Applicant's alleged invention involves merely the slitting of the curved guide members or slippers shown by Ricardo. Inasmuch as this feature appears to be the only patentable novelty over the reference, the claims in this case are unnecessarily multiplied and applicant is required to cut the number of claims down in proportion to the pat-

entable subject matter contained in the case. See in re Duncan 276 O. G. 211.

Claims 4 and 8 appear allowable.

P. P. PIERCE,
Examiner.

IN THE UNITED STATES PATENT OFFICE

Applicant	: Frank Jardine.	Div. 12, Ch. 1.
Invention	: Pistons.	Room 322.
Serial No.	: 450,898.	
Filed	: Renewal.	

Cleveland, Ohio.
February 2nd, 1922.

Hon. Commissioner of Patents,
Washington, D. C.

Sir:—

Responsive to Office Action dated January 30th, 1922. Cancel claims 1, 2, 3, 5, 7, 11, and 12, and renumber the remaining claims consecutively.

REMARKS

Applicant has materially reduced the number of claims in the case, and asks that the remaining claims be allowed. These cancellations bring the case well within the practice in this art, as indicated by the patents to Mooers, 1,402,309, Jan. 3, 1922, and Turner, 1,312,879, and 1,312,880, Aug. 12, 1919.

On reconsideration, applicant believes the Examiner will agree that the claims recite combinations of elements, and are not, as the Examiner suggests, merely the piston of the Ricardo patent with the addition of a slot. This follows from the fact that the addition of the slot changes the structure and the resistance to, and the disposal of, the forces within and without the piston when the piston is in use. Pressures operating on the piston, will oper-

ate in different directions and must be met and handled in such a way as to realize the advantages sought for.

364997—31

The Ricardo piston has not been generally adopted commercially, while the claimed pistons are in quite general and successful commercial use. Consequently, the various parts operate in a different manner from the Ricardo piston.

We have carefully considered the decisions of ex parte Duncan and in re Duncan. Duncan's case was an extraordinary one, requiring drastic handling, we are satisfied that neither the Commissioner nor Judge Van Orsvel intended to depart from the well established rule set up in the following cases:

In *Dick v. Underwood*, 246 F. R., 309, Judge Hazel said, at p. 313:—

> "Criticism is made upon the multiplication of claims; but, as they all relate to the same subject-matter and are both broad and specific, they were undoubtedly differently phrased to protect the patentee against any possible prior inventions, an expedient that does not invalidate them. *Parke & Davis & Co. v. H. K. Mulford Co.* (C. C.) 189 Fed. 95, affirmed 196 Fed. 496, 116 C. C. A. 262."

In *Parke v. Mulford*, 189 F. R., 95, Judge Hand said, at p. 102 and 103:—

> "The first of the technical objections is because of the vague character of the claims of the patent and their fraudulent reduplication. I can see no basis whatever for this contention. As I have already said, the claims were not for the active principle, nor for the product of the process. Of course claims for a product not defined as the product of a process must contain in themselves adequate differentia, or they will not be good (*Cochrane v. Baddische Anilin Fabrik*, 111 U. S. 293, 310, 4 Sup. Ct. 455, 28 L. Ed. 433); *but the only valid objection to multiplication of claims is when it appears that the patentee is trying deceitfully to go beyond the fair scope of his invention.* I can see no evidence of that here, and the fact that I have sustained the broader claim is a complete answer to such a position. That Takamine in a number of instances should have added other claims more circumscribed in their scope was natural enough, and *what every prudent solicitor ought to do.*

No one can in advance know how far anticipations will go or how little in the end his patent will cover. There is nothing improper, so far as I can see, in first putting your claims as broadly as in good faith you can, and then, *ex abundanti cautela*, following them successively with narrower claims designed to protect you against possible anticipations of which you are not yet aware. Indeed, the very case upon which the defendant relies (*Matheson v. Campbell*, 78 Fed. 910, 917, 24 C. C. A. 384) shows the necessity of claims as broad as one can honestly support. If

any one of the specified differentia of the claim is missing, the defendant's product does not infringe; if any anticipation includes all the differentia, the claim is bad. To pass between this Scylla and the Charybdis, I think a patentee may fairly be entitled to bend sails upon many yards." (Italicizing ours.)

Indeed, the decision of ex parte *Halverson*, 283 O. G. 182, is a warning that ex parte *Duncan* is not to change the well established practice which has been followed in the Federal cases we have cited.

In addition to the reasoning of the courts in the cited cases, we might add that we have found no record of any patent which has been held invalid because of the multiplicity of claims, though many patents have been assailed on that ground. On the contrary, the number of patents which have failed because of too few claims is legion. The equity spirit, which should prevail in adjudicating the claims on meritorious inventions, dictates that the doubt be resolved in favor of allowing the claims, and not by restricting them, endanger the protection on the invention.

If we were to limit ourselves to claim 8 alone of the group including 8 to 17, and prior art, not now developed, was found to anticipate this claim, that feature of the invention would be defeated, and the inventor would be without protection thereon. Such prior art might not, however, as frequently happens, anticipate the narrower claims such as 9 to 17 inclusive.

It has been our observation that settled doctrines of law, like that established by the Federal authorities which we have cited, are often disturbed by some extraordinary case or some extraordinary view of some particular court, and that much harm is done by an effort to follow the extraordinary case or the extraordinary view, and

that ultimately the law goes back into the established channel. It would be regrettable, if the very useful invention here under consideration, were in any way impaired

by departing from the established law as set forth in the Federal decisions which we have cited.

As a matter of precaution, we say that the cancellation of claims made in this amendment, has not been made with the purpose of abandoning the subject matter thereof, but, merely to meet the Examiner's requirement with regard to the number of claims, and because the remaining claims cover the substance of those cancelled.

An allowance is requested.

Respectfully,

B. D. WATTS,

Attorney for Applicant.

Please find below a communication from the EXAMINER in charge of the application of Frank Jardine, Filed Mar. 9, 1921, Serial No. 450,898, PISTONS.

THOMAS E. ROBERTSON,
Commissioner of Patents.

Responsive to the amendment of Feb. 6, 1922.

Claim 4, 5, 7, 8, 9 and 10 are rejected as being unpatentable over claim 3 in view of Ricardo, of record. The remarks submitted by applicant on Feb. 6, 1922 and the decisions therein cited have been carefully noted but it is not thought that they are in point with the question at issue. The Examiner does not contend that a patent would be rendered invalid by reason of the fact that the claims therein have been unduly multiplied or even that they were duplicates of each other. It is thought that applicant should point out the patentable difference between the several claims. At the present time the Examiner is unable to discover any such patentable difference between the same.

The remaining claims are allowed.

P. P. PIERCE,
Examiner.

(Application Room Jun 15 1922 U. S. Patent Office)
Division 12, Paper No. 12
Jun 16 1922
U. S. Patent Office

IN THE UNITED STATES PATENT OFFICE

In the application of
Frank Jardine,
For Pistons
Serial No. 450,898,
Filed March 9, 1921.

Cleveland, Ohio, ~~May~~ June 14 1922.

Hon. Commissioner of Patents,
Washington, D. C.

Sir:

Applicant responds as follows to the official action dated May 6, 1922.

It is noted that claims 1, 2, 3 and 6 have been allowed, but that claims 4, 5, 7, 8, 9 and 10 are rejected as unpatentable over allowed claim 3 in view of Ricardo.

It is further noted that the examiner thinks the claims should be patentably different and that such difference between the various claims should be pointed out.

Applicant believes that it is not the rule to require that the various claims in a case should be patentably dif-

ferent from each other in the sense that claims in different applications are required to be distinguished. Where the claims in one application must set forth a structure patentable over structure allowable in another case, the claims in a single application need not be so clearly distinguished. If another rule is followed it would be impossible to obtain broad and narrow claims of the same structure in a single application, as this has been repeatedly held to be not only permissible but essential in proper soliciting of patents. (See two cases cited in applicants amendment dated February 6, 1922 in this application.)

Although it has been held by the courts that every claim of a patent is to be considered as setting forth a complete and independent invention, this practice has not been followed to the extent which the language might lead one to expect, since it has been repeatedly held that if two or more claims appear to be alike they will, if practicable, be held to differ rather than to agree. (See Walker on patents 5th Addition page 226, paragraph 177.)

This practice was followed in each of the cases quoted from in applicant's last action where broad and narrow claims which differ in phrasing were held to be valid.

Furthermore, applicants contention that claims in an application need not differentiate patentably over each other is sustained by the case of *Wm. B. Scaife & Sons Co v. Falls City Woolen Mills.* (Circuit Court of Appeals, 209 F. R. 210, November 4, 1913.) The pertinent part of this Circuit Court decision is as follows, the italics being ours.

> This patent is one having a series of twelve claims. It is sometimes said that in such case each claim should be considered as a separate patent. This statement, accurate enough for some purposes, is misleading, if followed too far; but we must at least say that, usually, proper construction and effect can be given to each claim only by differentiating it from the other claims. *Each claim should be capable of such differentiation else it has no right to exist*; and the difficulty often found in doing so, caused by repetition and confusion, does not effect the propriety of this rule of construction in a normal case where it can be clearly applied. *Each claim*

should be directed at some function, step, or advantage to give it individuality; it should have a characterizing thought of point by which it can be identified; and, of the court which is to construe the claim can find this dominant thought, its task will be simplified.

Assuming the rule to be as set forth by applicant, the distinctions between the various claims will now be pointed out. Claims 4, 8 and 10 belong to the same general group, involving chordal webs differently defined in the various claims, each claim being distinguished from claim 3 by limitations to the specific kind of webs, namely, chordal webs as contrasted with other types of webs

which was described by the broader wording of claim 3.

Similarly claims 5, 7 and 9 belong to a single group where each of the claims is distinguished from the others by certain limitations. For example, claim 5 sets forth a skirt relieved adjacent the webs, claim 7 sets forth a pair of webs with a skirt connected to the side edges of the webs, and claim 9 sets forth the skirt extending beyond the webs. In addition to being thus different from one another the claims are distinguished from claim 3 among other things in these particulars above mentioned.

It has been our personal experience that patents are often held invalid because of having too few claims, but that multiplicity of claims has never been the cause of a patent being held invalid. If a court should decide there are too many claims it may declare certain ones thereof invalid without invalidating the whole patent. Furthermore, if a patent is granted with a limited number of claims it may and in fact often does happen that a meritorious invention is lost to the inventor through non-infringement of anyone of the claims granted, whereas if additional claims stating the invention is slightly different terms, has been issued the competing structure would have been technically, as it was actually, an infringement. By insisting on the claims in this case applicants attorney is inspired ~~in~~ by the belief that both the examiner and himself are working to the common end of issuing patents covering the invention in a manner to assure to the inventor the full benefit of his invention.

The accomplishing of anything less than this injustly deprives the inventor of what was rightfully his and reflects on the workmanship of both the attorney and examiner.

It is believed that the claims now in the case are allowable, and for the many reasons heretofore cited

should be granted. An early allowance is earnestly requested.

Respectfully submitted,

B. D. WATTS.

DEPARTMENT OF THE INTERIOR
UNITED STATES PATENT OFFICE
Washington Oct. 5, 1922

B. D. Watts,
451 Lennox Bldg.,
East 9th St. & Euclid Ave.,
Cleveland, Ohio.

Please find below a communication from the Examiner in charge of the application of Frank Jardine, Filed Mar. 9, 1921, Serial No. 450,898, PISTONS.

THOMAS E. ROBERTSON,
Commissioner of Patents.

Amended July 21, 1922.

Claims 1, 2, 3, 6 and 11 are allowed.

Claims 4, 5, 7, 8, 9 and 10 are again rejected upon the references and for the reasons given in the last office action.

Referring to applicant's remarks submitted June 15, 1922, it is thought that the arguments and authorities

therein set forth are not in point with the issue now being discussed relative to the case at bar. The Examiner has never contended that the various claims in a case should be patentably different from each other in the sense that claims in different applications are required to be different. But, the Examiner does maintain, that where a claim clearly and completely sets forth the applicant's contribution to the art to which his invention appertains, no good reason is seen, and none has been advanced for allowing a large number of claims, which not only do not include anything new and patentable in addition to the novel feature, already covered, but do not even describe the novel and patentable feature itself in slightly different terms. In the present case applicant is attempting to add old and unpatentable features to his invention for which he has already been

364997—41

450,898—2

granted protection by the allowed claims.

If the rejected claims are allowable they are so not because they include "cordal webs" (as against "webs" set forth in claim 3), or because the "webs" extend downwardly from the head, (whereas claim 3 only states that the webs are "integral with the head"), or because the skirt is "integrally connected to each of the side edges of the webs," or because the "webs are substantially rectangular in shape" or because the "skirt extends beyond the webs."

Not any of the above structural limitations, taken singly or in the aggregate, which characterize the chief difference between the allowed and rejected claims, are patentable over Ricardo, of record. For, it is to be noted that Ricardo shows a piston whose head and skirt are separated from each other by circumferential slots, a plurality or a pair of cordal webs integrally with and extending downwardly from the head, said webs being in parallel relation to each other, and having opposed wrist pin bosses, said webs being rectangular in shape and having joined thereto at their side edges the skirt of the piston which skirt extends below the said webs. Applicant's only contribution to the art, as developed by Ricardo, is the splitting of the guide sections or slippers. For this he has ample protection in the allowed claims.

As heretofore stated, it is thought to be well settled in the law that a claim to be properly allowable must define something novel and patenta[illegible] over what forms the

basis for patentability in the allowed claims. To do otherwise would be to invite controversy and litigation.

The foregoing considerations dispose of the issue in the case and as the Examiner is firmly of the opinion that the rejection of May 6, 1922 was proper, the same

364997—42

450,899—3

is made final from which applicant may appeal to the board of Examiners-in-Chief if he so desires.

Washington, April 5, 1923.

B. D. Watts,
451 Lennox Bldg.,
East 9th & Euclid Ave.,
Cleveland, Ohio.

Please find below a communication from the Examiner in charge of the application of Frank Jardine, Filed Mar. 9, 1921, Serial No. 450,899 Pistons.

THOMAS E. ROBERTSON,

Commissioner of Patents.

The following claims are suggested to the applicant for the purpose of interference:

—A piston comprising a head, a skirt separated at its periphery from the head, and pin bosses connected to the head and to the upper and lower parts of the skirt, said skirt being split longitudinally at one side between its connections to said bosses.

A piston comprising a head portion, a skirt portion, two separated pin bosses, connecting flanges in the zone of the bosses and extending from the bosses to the skirt on both sides of the bosses, connecting means from each of the bosses to the head portion, the skirt portion being entirely separated from the head portion except through the boss connections, and the skirt portion being split longitudinally of the piston to permit free expansion and contraction.

A piston comprising a head portion, a skirt portion, two separated pin bosses, connecting flanges in the zone of the bosses and extending from the bosses to the skirt on both sides of the bosses, connecting means from each of the bosses to the head portion, the skirt portion being entirely separated from the head portion except through the boss connections, and the skirt portion being split longitudinally of the piston to permit free expansion and contraction and the skirt portion being cut away adjacent the outer ends of the piston bosses.

A piston for internal combustion engines comprising in combination a head portion having an end wall and a side wall, a guide portion having on one side a cylinder-engaging part disposed to take the angular thrust of a connecting rod during one stroke of the piston, said cylinder-engaging part being separated at its upper end from said side wall by an air gap and being split longitudinally to accommodate expansion incident to the heating of the piston, a pair of separated pin bosses, and walls integrally uniting said bosses, the guide portion and the head portion.

364997—44

450,898—2

A piston comprising a head and body, internal yielding ribs supporting the head and body, and means on said ribs adapted to form engaging connection with operable parts for said piston.

A piston open at one end and having a packing ring supporting portion and a cylinder engaging portion, said cylinder engaging portion having a slot which is cut

through the thickness of its peripheral wall and extending from the open end of the piston to said ring supporting portion, a pair of wrist pin bearings depended from said ring supporting portion separated from said cylinder engaging portion, and tying means extending from each of said wrist pin bearings each being co-operably connected at their opposite ends to said cylinder engaging portion.

A piston for internal combustion engines comprising a head having downwardly extending resilient arms carrying curved guide members, said head being of less diameter than the diameter of the guide members.

In a piston of the class described, a cup-like head comprising a pressure receiving end and a wall portion, a skirt circumferentially disconnected from the wall portion of the head and divided from end to end, and skirt carriers connecting said skirt to the pressure receiving end, said skirt carriers being disconnected from the wall portion of the head and susceptible of being slightly flexed radially.

A piston having a head with top and side walls in combination with a guide structure connected thereto and comprising diametrically opposite cylinder-engaging parts formed with air spaces between their upper edges and the bottom edge of the side wall of the head, wrist pin bosses between the cylinder-engaging parts, and means joining said bosses and cylinder-engaging parts together, the said joining means being resiliently yieldable and arranged not to engage the cylinder.

A piston having a head and a cross-head structure connected thereto and comprising diametrically opposite slippers, wrist pin bosses between the slippers and means joining said bosses and slippers together, the said joining means being resiliently yieldable.

A piston comprising a head, a skirt having resilient sections separated from said head by a slit extending continuously around the piston, and means for yieldingly connecting said skirt sections with said head.

Failure to make the above claims within thirty days from the date of mailing of this letter will be taken as a disclaimer of the subject matter covered thereby.

R. M. WEAVER,

Acting Examiner, Div. 12.

Applicant Frank Jardine
Invention Pistons
Serial No. 450,898
Filed March 9, 1921

E Cleveland, Ohio, April 30th, 1923.

Hon. Commissioner of Patents,
Washington, D. C.

Sir:—

In response to the Official Action dated April 5, 1923 in which certain claims were suggested to applicant for purpose of interference, applicant amends as follows:

Insert the following claims as Claims 11 to 21 inclusive.

E' ~~11.~~ **12E** A piston comprising a head, a skirt separated at its periphery from the head, and pin bosses connected to the head and to the upper and lower parts of the skirt, said skirt being split longitudinally at one side between its connections to said bosses.

Per G ~~12.~~ **13E** A piston comprising a head portion, a skirt portion, two separated pin bosses, connecting flanges in the zone of the bosses and extending from the bosses to the skirt on both sides of the bosses, connecting means from each of the bosses to the head portion, the skirt portion being entirely separated from the head portion except through the boss connections, and the skirt portion being split longitudinally of the piston to permit free expansion and contraction.

~~13.~~ **14E** A piston comprising a head portion, a skirt portion, two separated pin bosses, connecting flanges in the zone of the bosses and extending from the bosses to

the skirt on both sides of the bosses, connecting means from each of the bosses to the head portion, the skirt portion being entirely separated from the head portion except through the boss connections, and the skirt portion being split longitudinally of the piston to permit free expansion and contraction and the skirt portion being cut away adjacent the outer ends of the piston bosses.

~~14.~~ **15E** A piston for internal combustion engines comprising in combination a head portion having an end wall and a side wall, a guide portion having on one side a cylinder-engaging part disposed to take the angular thrust of a connecting rod during one stroke of the piston, said cylinder-engaging part being separated at its upper end from said side wall by an air gap and being split longitudinally to accommodate expansion incident to the heating of the piston, a pair of separated pin bosses, and walls integrally uniting said bosses, the guide portion and the head portion.

~~15.~~ **16E** A piston comprising a head and body, internal yielding ribs supporting the head and body, and means on said ribs adapted to form engaging connection with operable parts for said piston.

~~16.~~ **17E** A piston open at one end and having a packing ring supporting portion and a cylinder engaging portion, said cylinder engaging portion having a slot which is cut through the thickness of its peripheral wall and extending from the open end of the piston to said ring supporting portion, a pair of wrist pin bearings depended from said ring supporting portion **and** separated from said cylinder engaging portion, and tying means extending from each of said wrist pin bearings each being co-operably connected at their opposite ends to said cylinder engaging portion.

~~17.~~ **18E** A piston for internal combustion engines comprising a head having downwardly extending resilient arms carrying curved guide members, said head being of less diameter than the diameter of the guide members.

~~18.~~ **19E** In a piston of the class described, a cup-like head comprising a pressure receiving end and a wall portion, a skirt, circumferentially disconnected from the wall portion of the head and divided from end to end, and skirt carriers connecting said skirt to the pressure receiving end, said skirt carriers being disconnected from the wall portion of the head and susceptible of being slightly flexed radially.

~~19.~~ **20E** A piston having a head with top and side walls in combination with a guide structure connected thereto and comprising diametrically opposite cylinder-engaging parts formed with air spaces between their upper edges and the bottom edge of the side wall of the head, wrist pin bosses between the cylinder-engaging parts, and means joining said bosses and cylinder-engaging parts together, the said joining means being resiliently yieldable and arranged not to engage the cylinder.

~~20.~~ **21E** A piston having a head and a cross-head structure connected thereto and comprising diametrically opposite slippers, wrist pin bosses between the slippers and means joining said bosses and slippers together, the said joining means being resiliently yieldable.

~~21.~~ **22E** A piston comprising a head, a skirt having resilient sections separated from said head by a slit extending continuously around the piston, and means for yieldingly connecting said skirt sections with said head.

REMARKS.

Please find below a copy of a communication from the Examiner concerning the application of Frank Jardine, Filed Mar. 9, 1921, Serial No. 450,898, PISTONS.

Very respectfully,

THOMAS E. ROBERTSON,
Commissioner of Patents.

Room No. 322

Address only
The Commissioner of Patents
Washington, D. C.

49569

The case, above referred to, is adjudged to interfere with others, hereafter specified, and the question of priority will be determined in conformity with the Rules.

The statement demanded by Rule 110 must be sealed up and filed on or before Aug. 27, 1923, with the subject of the invention, and name of party filing it, indorsed on the envelope. The subject-matter involved in the interference is

Count.

1. A piston for internal combustion engine comprising in combination a head portion having an end wall and a side wall, a guide portion having on one side a cylinder-engaging part disposed to take the angular thrust of a connecting rod during one stroke of the piston, said cylinder-engaging part being separated at its upper end from said side wall by an air gap and being split longitudinally to accommodate expansion incident to the heating of the piston, a pair of separated pin bosses, and walls integrally uniting said bosses, the guide portion and the head portion.

This interference involves your application above identified and an application for PISTONS, filed by Ray E. Day, of 3825 North 24th St., Tacoma, Wash., whose attorney is Clarence E. Mehlhope, of Marquette Bldg., Chicago, Ill.,

An application for PISTONS, filed by George A. Taylor, of 164 Dana Avenue, Hyde Park, Mass., whose attorney is Macleod, Calver, Copeland and Dike, of Tremont Bldg., Boston, Mass.,

An application for PISTONS, filed by Howard E. Maynard, of 700 Calvert Avenue, Detroit, Michigan, whose

attorney is Whittemore, Hulbert & Whittemore, of Penobscot Bldg., Detroit, Michigan,

An application for PISTONS, filed by Stephen D. Hartog, of 3219 Natural Bridge Avenue, St. Louis, Mo., whose attorney is Rippey and Kingsland, of The Rialto Bldg., St. Louis, Mo.,

An application for INTERNAL COMBUSTION ENGINE PISTONS filed by Elmer C. Long, of 1037 Main St., Quincy, Illinois, whose attorney is Herbert G. Fletcher, of 321 International Life Bldg., c/o Knight Bros., St. Louis, Missouri, and

An application for PISTONS, filed by Edward J. Gulick, of P. O. Box 553, Elkhart, Indiana, whose attorney is Milton Tibbetts, of c/o Packard Motor Car Company, Detroit, Michigan, and whose assignee is the Cleveland Trust Company, of Cleveland, Ohio, a corporation of Ohio.

The relation of the count of the interference to the claims of the respective parties is as follows:

Count	Day	Gulick	Hartog	Jardine	Long	Maynard	Taylor
1	14	15	30	15	10	12	13.

The case, above referred to, is adjudged to interfere with others, hereafter specified, and the question of priority will be determined in conformity with the Rules.

The statement demanded by Rule 110 must be sealed up and filed on or before Aug. 27, 1923, with the subject of the invention, and name of party filing it, indorsed on the envelope. The subject-matter involved in the interference is

Count.

1. A piston for internal combustion engines comprising a head having downwardly extending resilient arms carrying curved guide members, said head being of less diameter than the diameter of the guide members.

This interference involves your application above identified and an application for ENGINE PISTONS, filed by Albert Spillman, of 261 Payne Ave., North Tonawanda, New York, and whose attorney is Geyer & Popp, of 619 Brisbane Bldg., Buffalo, N. Y.,

An application for PISTONS, filed by Stephen D. Hartog, of 3219 Natural Bridge Ave., St. Louis, Mo., and whose attorney is Rippey & Kingsland, of The Rialto Bldg., St. Louis, Mo; and

The case, above referred to, is adjudged to interfere with others, hereafter specified, and the question of priority will be determined in conformity with the Rules.

The statement demanded by Rule 110 must be sealed up and filed on or before Aug. 27, 1923, with the subject of the invention, and name of party filing it, indorsed on the envelope. The subject-matter involved in the interference is

Count.

1. In a piston for an internal combustion engine the combination of a head comprising a head disc and a peripheral flange having ring grooves therein, a pair of cordal webs, substantially rectangular in shape and located opposite each other in the piston, connected integrally at their upper edges to the peripheral flange of the piston, diametrically opposite wrist pin bosses, one in each of said webs, a skirt for said piston integrally connected to each of the side edges of the webs and cut away so as to expose each of the rectangular webs and the piston pin bosses from the outside of the piston, said piston being provided with circumferential slots between the skirt and head and with a longitudinal slot extending from one of the circumferential slots to the open end of the piston.

This interference involves your application above identified and an application for PISTONS, filed by Howard E. Maynard, of 700 Calvert Ave., Detroit, Michigan, and whose attorney is Whittemore, Hulbert & Whittemore, of Penobscot Bldg., Detroit, Michigan.

The relation of the count of the interference to the claims of the respective parties is as follows:

The case, above referred to, is adjudged to interfere with others, hereafter specified, and the question of priority will be determined in conformity with the Rules.

The statement demanded by Rule 110 must be sealed up and filed on or before Aug. 27, 1923, with the subject of the invention, and name of party filing it, indorsed on the envelope. The subject-matter involved in the interference is

Counts.

1. In a piston for an internal combustion engine, the combination of a piston head having a depending ring flange, two pairs of curved guide members oppositely disposed with relation to the axis of the piston, the curved members of each pair thereof being separated from the ring flange and from each other by continuous air gaps, and webs carrying wrist pin bosses, the said curved members, piston head and webs being united in an integral unitary structure.

2. In a piston for an internal combustion engine, the combination of a piston head having a depending ring flange, two pairs of curved guide members oppositely disposed with relation to the axis of the piston, the curved members of each pair thereof being separated from the ring flange and from each other by continuous air gaps, wrist pin bosses and webs connecting the wrist pin bosses with certain of said guide members, said guide members piston head and webs being united in an integral unitary structure.

This interference involves your application above identified and an application for PISTONS FOR INTERNAL COMBUSTION MOTORS, filed by Elmer C. Long, of 1037 Main St., Quincy, Illinois, and whose attorney is Herbert G. Fletcher, of c/o Knight Bros., 321 International Life Bldg., St. Louis, Missouri.

Applicant —Frank Jardine
Application—Pistons
Serial No. —450,898
Filed —March 9, 1921

Cleveland, Ohio,
August 7, 1928.

The Commissioner of Patents,
F Washington, D. C.

Sir:

Applicant hereby amends as follows:

Add the following claim—

A one piece piston comprising a head and a skirt, the skirt having boss carrying portions exteriorly relieved and arranged opposite each other and secured to the head by substantially rigid connectors to
Per H cause radially outward and inward movement of the portions under operation conditions of the piston, the skirt also having opposite bearing wall portions arranged between the said boss carrying portions and each separated from the head by a slot of greater circumferential length than the corresponding length of the said portions.

Respectfully submitted,

FRANK JARDINE,
By RICHEY & WATTS,
His Attorneys.

REMARKS

Applicant makes the above claim which is Count 4 of Interference No. 56,380, Franquist vs. Covert.

—1— 364997—93

The claim is Covert's claim 15 and Franquist's claim 31. Applicant has recently learned that an interference regarding this subject matter existed and has made the claim promptly upon learning of the same.

The claim reads upon the Jardine construction as follows: The head of the piston is shown at 1 and the skirt at 2. The boss-carrying portions are shown at 6 which are relieved about the bosses. The boss-carrying portions are arranged opposite to each other and secured to the head by substantially rigid connectors to which the reference numerals 9 are attached and which cause the outward and inward movement of the skirt portions. The opposite bearing walls of the skirt portions are shown at 10, each of which is separated from the head by slots 11 which extend as is best shown in the upper left-hand corner of Fig. 1 beyond the bearing faces.

Respectfully submitted,

RICHEY & WATTS,
Applicant's Attorneys.

(Chief Clerk May 8 30 U. S. Patent Office)

U. S. Patent Office
May 8 1930
Division 12, Paper No. 52

Applicant —Frank Jardine
Application—Pistons
Serial No. —~~364,997~~ 450,898
Filed —March 9, 1921
Docket No. —1977

Division 12

Cleveland, Ohio, May 7, 1930.

Hon. Commissioner of Patents,
Washington, D. C.

Sir:

In response to Official Action dated February 8, 1930 applicant amends as follows:

Claim 4, line 7, cancel "connecting" and substitute —*lying on a line extending from*—. Same line cancel "with" and substitute —*to*—.

Claim 5, line 5, after "webs" insert —*to expose said bosses*. Line 7 after "slot" insert —*lying on a line extending from*—.

Cancel Claims 1, and 11 to 22 inclusive.

Add the following claims:

23. 3. An internal combustion engine piston comprising a head having a depending ring flange, webs integrally cast to the ring flange and depressed within the circumference defined by the ring flange, wrist pin bosses cast in the webs, and curved guide means integrally cast to the webs and provided with a longitudinal slit disposed between the ends of the webs on one side of the piston, the outer surface of the guide means being disposed in a circumference outwardly of the outer surface of the webs and merging into the latter at included angles sufficiently great to permit the removal of a permanent mold part used to form the outer surface of the piston.

(over)

364997—96

I 901

24. 4 In a piston for an internal combustion engine, the combination of a head having a depending circumferential flange provided with ring grooves on the exterior thereof, chordal webs integral with the head and depending therefrom in opposite positions, piston pin bosses, one located in each web opposite each other, a skirt portion cut away from the head to expose the bosses in the webs and provided with curved bearing faces integral with the webs and connected to the ends of the webs opposite each other, each of said bearing faces being separated from the head except for the integral connection through the webs and one of said bearing faces having a substantially vertical slot therein.

25. 5 In a piston for an internal combustion engine, the combination of a head having a depending circumferential flange provided with ring grooves on the exterior thereof, chordal webs integral with the head and depending therefrom in opposite positions, piston pin bosses one located in each web opposite each other, ribs integral with and substantially perpendicular to the webs joining the webs and the head, a skirt portion cut away from the head to expose the bosses in the webs provided with curved bearing faces integral with the webs and connected to the ends of the webs opposite each other, each of said bearing faces being separated from the head except for the integral connection through the webs and one of said bearing faces having a substantially vertical slot therein.

26. 6. In a piston for an internal combustion engine, the combination of a head having a depending circumferential flange provided with ring grooves on the exterior thereof, chordal webs integral with the head and depending therefrom in opposite positions, piston pin bosses, one located in each web opposite each other, ribs integral with and substantially perpendicular to the webs joining the webs, the bosses and the head together, a skirt portion cut away from the head to expose the bosses in the webs and provided with curved bearing faces integral with the webs and connected to the ends of the webs opposite each other, each of said bearing

364997—97

I 902

faces being separated from the head except for the integral connection through the webs and one of said bearing faces having a substantially vertical slot therein.

27. 7 A piston for an internal combustion engine comprising a head portion having a depending ring flange, a skirt portion, said skirt portion comprising a pair of substantially parallel webs carried by the head portion and provided with opposed wrist pin bosses, bearing portions carried by the ends of said webs and separated from the head by air gaps, the laterally outer faces of said web portions being free from laterally overhanging edge portions of the bearing faces, one of said bearing faces being provided with a longitudinal slot disposed intermediate the end portions of said bearing face.

28. 8 In a piston for an internal combustion engine, the combination of a head having a cylindrical ring flange, oppositely disposed webs integral with the flange and carrying diametrically opposite piston pin bosses, a skirt integral with said webs and cut away to expose the sides of said webs and separated from the ring flange by circumferential slits and provided with a longitudinal slit disposed between the ends of the webs.

29. 9 In a piston for an internal combustion engine, the combination of a head comprising a disc and a peripheral flange having ring grooves therein, a pair of cordal webs connected to the flange of the head by outwardly flaring extensions, oppositely disposed wrist pin bosses in the webs, and a cylindrical skirt cut away to expose the webs and integrally connected to the ends of the latter, the skirt being separated from the head

between the said webs by circumferential slits and the skirt having a longitudinally extending slit disposed between the ends of the webs on one side of the piston.

364997—98

I 903

~~30.~~ 10 In a piston for an internal combustion engine, the combination of a piston head including a depending ring flange, oppositely disposed webs depending from the ring flange and disposed inwardly thereof, wrist pin bosses in the webs, and curved bearing means integrally connected to the webs and separated from the head by air gaps extending circumferentially of the piston between the ends of the webs, the said bearing means having a slit located between the ends of the webs and extending in a direction lengthwise of the piston.

~~31.~~ 11 In a piston of an internal combustion engine, the combination of a piston head having a cylindrical ring flange depending therefrom, webs integral with the flange extending convergingly inwardly of the piston from the opposite portions of the flange and then lengthwise of the piston in substantially parallel arrangement, wrist pin bosses in the webs, and a skirt joined to the ends of the webs on opposite sides of the bosses and cut away to expose substantially all of the sides of the webs, all the foregoing parts being integrally connected together, there being circumferentially extending air gaps separating the head and skirt between the webs and a slot in one side of the skirt between the ends of the webs and extending in a direction lengthwise of the piston.

~~32.~~ 12 In a piston for an internal combustion engine, the combination of a piston head comprising a disc with a depending peripheral ring flange, a skirt separated from the head by circumferentially extending air gaps, cordal webs integrally connected at their end to the skirt with their outer surfaces near the points of connection with the skirt diverging outwardly to merge into the outer surfaces of the skirt, wrist pin bosses integrally formed with the webs, and integral connections between the depending flange of the head and the adjacent ends of the webs, said connections extending from the flange inwardly and lengthwise of the piston and merging into the webs with outwardly diverging sur-

faces, the skirt having a longitudinally extending slit formed on one side thereof between the ends of the webs.

(Sig.)
364997—99
I 904

Respectfully submitted,

FRANK JARDINE,
By RICHEY & WATTS,
His Attorneys.

REMARKS

The claims constituting the issues of the interferences which were decided adversely to applicant have been canceled and new claims drawn specifically to the patentable subject matter of Applicant's device substituted.

Claims 3 and 6 constituted the issue of interferences No. 49582 and 49589, in which priority was awarded to applicant.

Claims 4, 5, 6, 8, 9, and 10 were, before the declaration of the interferences, rejected as not being patentably distinct from claim 3. Accordingly the subject matter of these claims is believed to be allowable along with claim 3.

Claims 4 and 5 have been amended slightly to further distinguish from claim 3, and it is believed that all of these claims may now be allowed.

New claim 23 includes webs cast integrally with the ring flange and also recites the relation of the thrust members and webs which join at included angles sufficiently great to permit removal of a permanent mold part used in casting the piston. These limitations distinguish from the prior art and from the applications involved in the interferences. Claim 24 is believed to be patentable by reason of the recitation of a skirt portion cut away from the head to expose the bosses in combination with the other elements of applicant's structure. Claim 25 includes in addition the vertical ribs 9 above the piston pin bosses joining the webs to the head. Claim 26 defines these ribs more specifically.

364997—100
I 905

Claim 27 is believed to be patentable by reason of the definition of the webs as having lateral outer faces

free from laterally overhanging edge portions of the bearing faces.

Claim 28 is similar to claim 3 but recites in addition that the webs are integral with the ring flange. Claim 29 distinguishes from Claim 6 in the same manner. Each of these claims also defines the longitudinal slit in slightly broader terms than claims 3 and 6.

Claim 30 is drawn along the lines of Claim 11 but distinguishes from the disclosure of the parties involved in the interferences by reciting the webs as depending from the ring flange.

Claims 31 and 32 are drawn more specifically to the structure of applicant's piston which permits its manufacture in permanent molds. Claim 31 states that the webs are integral with the flange and extend convergingly inwardly therefrom and have substantially all of their outer sides exposed. Claim 32 defines the outwardly diverging connections between the webs and the skirt sections and the outwardly diverging connections between the webs and the ring flange.

All of the claims now in the case are believed to be patentably distinct from the prior art and the disclosures of the winning parties in the interferences and are believed to be sufficiently distinguished from each other to warrant their allowance.

Respectfully submitted,

By Richey & Watts.

Applicant's Attorneys.

Division 12, Paper No. 53

Applicant	Frank Jardine	Division 12
Application	Pistons	
	~~450,898~~	
Serial No.	~~364,997~~	
Filed	March 9, 1921	
Docket No.	1977	

Washington, D. C.,
May 8, 1930.

Hon. Commissioner of Patents,
Washington, D. C.

Sir:

Kindly amend the above-entitled application as follows:

Cancel claims 2, 4, 5, 7, 8, 9 and 10.

Cancel the claim submitted in the amendment dated August 7, 1928.

Respectfully submitted,
FRANK JARDINE,
By RICHEY & WATTS,
His Attorneys.

REMARKS

At the interview courteously granted this day by the Examiner to applicant's attorney, claims 2, 4, 5, 7, 8, 9 and 10 were discussed in connection with the Office action of Oct. 5, 1922, and in connection with claims 23-32 inclusive, added by the preceding amendment.

The Examiner held claim 2 to be unpatentable over the issue of Interference No. 49590, involving applicant's claim 1. Accordingly, this claim has been cancelled.

Claims 4, 5, 7, 8, 9, and 10 have been cancelled as not being patentably distinct from Claim 3, and also because it is believed the patentable subject-matter thereof is more clearly defined in new claims 23-32, inclusive.

The claim submitted by the amendment dated Aug.

364997—102

7, 1928, which was not entered, has been cancelled in order to clarify the record.

Respectfully submitted,
By RICHEY & WATTS,
Applicant's Attorneys.

DEPARTMENT OF COMMERCE
UNITED STATES PATENT OFFICE

Washington May 9, 1930.

Frank Jardine (Assor etc.)

YOUR APPLICATION for a patent for an IMPROVEMENT in PISTONS filed Mar. 9, 1921 has been examined and ALLOWED with 12 claims.

The final fee, TWENTY DOLLARS, WITH $1 ADDITIONAL FOR EACH CLAIM ALLOWED IN EXCESS OF 20, must be paid not later than SIX MONTHS from the date of this present notice of allowance. If the final fee be not paid within that period, the patent will be withheld, but the application may be renewed within one year after the date of the original notice with a renewal fee of $20 and $1 additional for each claim in excess of 20.

The office delivers patents upon the day of their date, on which date their term begins to run. The preparation of the patent for final signing and sealing will require about four weeks, and such work will not be begun until after payment of the necessary final fee.

When the final fee is paid, there should also be sent, DISTINCTLY AND PLAINLY WRITTEN, the name of the INVENTOR, TITLE OF THE INVENTION, AND SERIAL NUMBER AS ABOVE GIVEN, DATE OF ALLOWANCE (which is the date of this circular), DATE OF FILING, and, if assigned, the NAMES OF THE ASSIGNEES.

If it is desired to have the patent issue to an ASSIGNEE OR ASSIGNEES, an assignment containing a REQUEST to that effect, together with the FEE for recording the same, must be filed in this office on or before the date of payment of the final fee.

After issue of the patent, uncertified copies of the drawings and specifications may be purchased at the price of TEN CENTS EACH. The money should accompany the order. Postage stamps will not be received.

The final fee will NOT be received from other than the applicant, his assignee or attorney, or a party in interest as shown by the records of the Patent Office.

NOTICE.—WHEN THE NUMBER OF CLAIMS ALLOWED IS IN EXCESS OF 20, NO SUM LESS THAN $20 PLUS $1 ADDITIONAL FOR EACH CLAIM IN EXCESS OF TWENTY CAN BE ACCEPTED AS THE FINAL FEE.

☞ IN REMITTING THE FINAL FEE GIVE THE SERIAL NUMBER AT THE HEAD OF THIS NOTICE.

☞ UNCERTIFIED CHECKS WILL NOT BE ACCEPTED.

Respectfully,

THOMAS E. ROBERTSON,
Commissioner of Patents.

Richey & Watts,
1983 Union Trust Bldg.,
Cleveland, Ohio.

NOTICE.

Final Fee effective June 1, 1930.
$25, with $1.00 additional for each claim in excess of 20.

Applicant Frank Jardine
Ser. No. 450,898 (Renewal)
Filed Mar. 9, 1921
For Pistons.

In accordance with the provisions of Order No. 2308, dated March 12, 1917, which reads in part as follows:

* * * * * * * * *

Obvious informalities in the application may be corrected by the examiner, but said correction must be in the form of an amendment, approved by the Principal Examiner in writing, placed in the file, and made a part of the record. The changes specified in the amendment will be entered by the clerk in the regular way.

* * * * * * * *

the changes, hereinafter specified, are made by the examiner in the application above identified.

Should these changes not be satisfactory to the applicant, appropriate amendment may be proposed under the provisions of Rule 78, provided the specification has not been printed.

The application has been amended as follows:

I

Claim 2, line 3, "*chordal*" has been substituted for "cordal."

DISTRICT COURT OF THE UNITED STATES

Eastern District of Michigan

Honorable Commissioner of Patents,
Washington, D. C.

Sir:

In compliance with the Act of February 18, 1922 (42 Stat. L. 392), you are advised that there was filed on the 19th day of September, 1932, in this court an action, suit, or proceeding No. 5564, entitled:

Name The Cleveland Trust Company, Plaintiff,
Address Cleveland, Ohio

versus

Name Ray Day Piston Corporation of Detroit, Defendant,
Address Detroit, Michigan

brought upon the following patents:

	Patent No.	Date of Patent	Patentee
1	1,402,309	Jan. 3d, 1922	Louis P. Mooers
2	1,763,523	June 10, 1930	Frank Jardine
3	1,815,733	July 20, 1931	Edward J. Gulick

In the above-entitled case, on the ..... day of ....., 193 , the following patents have been included by ..... (insert amendment, answer, cross bill, or other pleading):

Patent No.	Date of Patent	Patentee

In the above-entitled case the following decision has been rendered or decree issued:

IN WITNESS WHEREOF I have affixed my hand this Nineteenth day of September, 1932, at Detroit, Michigan.

ELMER W. VOORHEIS,
Clerk of said Court.

By: Albert L. Alhed,
Deputy Clerk.

364997—113

PRINTER'S NOTE:

A copy of U. S. Patent No. 1,763,523, June 10, 1930, to F. Jardine, was bound in the original of this Exhibit at this point, but inasmuch as it appears, *supra*, at page 1291, as Plaintiff's Exhibit No. 3, it has been omitted to comply with the Equity Rule against duplication.

PETITION

To the Commissioner of Patents:

Your petitioner, Victor E. Schmiedeknecht, a citizen of the United States, residing in the city of Louisville county of Jefferson, and state of Kentucky, whose post office address is 723 W. Jefferson, prays that letters patent may be granted to him for the improvement in "Pistons" set forth in the annexed specification.

And he hereby appoints William B. Munnell of 414 S. Third street, Louisville Kentucky, whose registration number is 9063, his attorney, with full power of substitution and revocation, to prosecute this application, to make alterations and amendments therein, to receive the patent and to transact all business in the Patent Office connected therewith.

Signed at Louisville, in the county of Jefferson and state of Kentucky this 11th day of July, 1917.

Inventor's full name VICTOR E. SCHMIEDEKNECHT.

180511—1

6296

~~SPECIFICATION~~

To all whom it may concern:

Be it known that I, VICTOR E. SCHMIEDEKNECHT, a citizen of the United States, residing at Louisville, in the county of Jefferson, and State of Kentucky, have invented a new and useful Improvement in "Pistons," of which the following is a specification.

This invention relates to pistons for internal combustion motors.

It has been ascertained to be essential that pistons of internal combustion motors should be as light as possible. In accordance with accepted construction pistons are hollow cylinders, closed at one end and open at the other, a connecting rod being secured interiorly thereof intermediate of their length by means of a transverse pin. Bosses projected inward from the side walls of the piston provide bearings for the pin. It was formerly ~~thot~~ thought that a shearing stress was exerted on this pin, and that the strain was transmitted to the side walls longitudinal thereof, and that the metal being under compression, the wall could be very thin, but failure of piston walls so constructed lead to the conclusion that the connecting rod exerted a bending stress on the pin by which a lateral strain was transmitted to the walls causing them to fracture around the bosses. This discovery necessitated an increase in the thickness of the walls and the use of braces or brackets extended from the bosses to the piston head, or to the wall, but these expedients tend to increase the weight of the piston. To reduce piston weight, resort has been had to the use of metals (such as aluminum, or alloys

thereof) which have a lower specific gravity than cast iron, the metal commonally used; but the co-

(1) 180511—2

Schmiedeknecht—Pistons 6297

efficient of expansion of alluminum is greater than that of iron, of which motor cylinders are generally made. Consequently it is difficult to get a proper fit, as for if the piston is of such size as to fit in the cylinder properly when at maximum temperature, gas and oil will leak by, when as at starting, the piston is cool.

per A

per A

An object of this invention is to provide a piston of minimum weight, with maximum structural strength.

To the accomplishment of the foregoing and other objects, said invention consists of the novel construction, association and relative arrangement of parts, members and features hereinafter fully described and particularly pointed out in the claims appended hereunto.

In the drawing, wherein similar reference characters designate like parts in the several views, Figure 1, is a front elevation of an embodiment of the invention: Fig. 2, a side elevation thereof: Fig. 3, a central transverse section on Fig. 1: Fig. 4, a bottom plan view: and Fig. 5, a fragmental sectional view.

per A

" "

Referering now in detail to the drawing, the reference character —10— designates, as an ~~entiety~~ entirety, a piston, the side walls, —11— of which are provided with a plurality of grooves —12— adapted for the reception of piston rings. An oil ~~ring~~ groove —13— is located just below the groups of piston ring grooves, and from the floor of this groove, a plurality of perforations —15— lead ~~thr~~through the wall of the piston, and serve as an avenue of escape for oil that may accumulate beneath the lower ring during the down stroke of the piston. The floor of this groove, is suitably inclined to facilitate the operation of drilling the holes, 15. The only portions of the apron of the piston (*i.e.* that portion of the wall which depends below the pin) which bear efficiently against the walls of the cylinder are those, fore and aft, which lie in the plane of the movement of the connecting rod about the pin. The side por-

(2) 180511—3

Schmiedeknecht—Pistons 6298

tions (those below the ends of the pin) serve to steady the piston against lateral motion. I remove a portions

of said apron, leaving ~~an~~ openings —16— each of which extends circumferentially approximately one per A ~~sixth~~ **third** of the distance around the piston, and longitudinally from a point just below the oil groove to within a spaced distance of the lower end of the piston, leaving a band —18— of sufficient width to give a satisfactory bearing surface. Alined bearings —19— each of which has a suitable bore —20— for the reception of a piston ~~ring~~ pin, are attached at per A 9 their outer ends to the **head section at the** upper edge of the openings —16— centrally thereof. per A The inner end of each of the bearings ~~are~~ **is** supported by a transverse bridge or truss —21— joined respectively, centrally to the bearings and terminally to the edges of the portions 17 of the apron of the piston.

per A It is ~~thot~~ **thought** that the many advantages of a piston constructed in accordance with the foregoing description will be evident to those skilled in the art.

The walls may be considerable thinner than with the usual construction, as they are not subjected to lateral strain, the bearings being supported on the inner end by a bridge supported by the side walls, which gives great rigidity to them, offering a maximum resistance to the bending strain exerted by the pin. The removal of portions of the apron also serves to reduce the weight.

It is to be understood that applicant reserves the right to resort to such changes, modifications, and variations, as may properly come within the scope of the appended claims.

Having thus described my invention so that those skilled in the art may make and use the same,

I claim:

180511—4

Schmiedeknecht—Pistons 6299

~~Claims~~

per A 1. A piston comprising a head **section** and a depending apron having oppositely disposed openings therein, alined bearings the outer ends per A of which are suspended from said ~~apron~~ **head section** within said openings, and bridges sustaining the inner ends of said bearings.

per A 2. A piston comprising a head **section**, and per A a depending cylindrical ~~side walls~~, **apron** said

~~side walls~~ **head section** being provided with a plurality of grooves for the reception of rings, and an oil groove having perforations leading from its
per B floor to the interior of the piston, said ~~wall~~ **apron** having an opening below said oil groove, a bearing the outer end of which is suspended
per A 6 from the **head section at** upper edge of said opening, and a transverse bar attached respectively
per A to the inner end of said bearing and to the ~~side wall~~ **apron.**

3. A piston, comprising a head, and a depending apron having an opening therein, a bearing the
per A outer end of which is attached to the **head at the** upper edge of said opening, and a transverse bar adapted to support the inner end of said bearing.

~~Applicants full Name~~ Victor E. Schmiedeknecht.

180511—5

Please find below a communication from the Examiner in charge of the application of Victor E. Schmiedeknecht, for Pistons, filed July 14, 1917, Serial Number 180,511.

JAMES T. NEWTON,
Commissioner of Patents.

This case has been examined.

Page 1, line 13 "thought" is misspelled. Line 22, change "tend" to *tending*. Line 24, "aluminum" is misspelled.

Page 2 line 2 change the comma after made to a period and capitalize the first letter of "consequently." Line 3, change "as" to *for*. Line 17 "referring" is misspelled. Line 18, "entirety" is misspelled.

Page 4, line 3 the openings "16" seem to extend more than 1/6 the way around the piston. Line 9 is objectionable. The bearings 19 are attached to the "head at the upper edge of the opening 16." Line 10 change "are" to *is*. Line 13 "thought" is misspelled.

In claim 1 line 3 "apron" should be changed to *head*.

Claim 2 is objectionable in the following respects.

Line 1 "side" should be cancelled and *a* inserted before "depending." Line 2 "walls" should be changed to *apron* and "side walls" changed to *head* after said. Line 4, "wall" should be changed to *apron*. Line 6, insert *head at the* before "upper." Last line change "side

180511—7

Page 2—#180,511.

wall" to *apron*.

In claim 3, line 3 insert *head at the* before "upper."

The claims barring the informalities above noted are probably allowable.

The following patents are made of record—

Spillman et al, 1,092,870, April 14, 1914, (74-85),

A
Hon. Commissioner of Patents:

Sir:

Amend the above noted case as follows:

Page 1, line 13, correct the spelling of "thought"
line 24, correct the spelling of "aluminum"

Page 2, line 2, change the comma after "made" to a period and capitalize "consequently"
line 3, change "as" to *for*
line 17, correct the spelling of "referring"
line 18, correct the spelling of "entirety"
Page 3, line 3, change "one sixth" to *one third*
line 9, before "upper" insert *head section at the;*
line 10, change "are" to *is*
line 13, change "thot" to *thought*
Claim 1, line 1, after "head" insert *section*
line 3, change "apron" to *head section*
Claim 2, line 1, after "head" insert *section:* insert *a;* before "depending" erase "side"
line 2, change "walls" to *apron*: change "side walls" to *head section*
line 6, insert *head section at the* before "upper"
last line change "side wall" to *apron*
Claim 3, line 3, insert *head at the* before "upper"

And pass the claim case to issue.

Respectfully submitted,

W. B. MUNNELL,
Attorney for Applicant.

Please find below a communication from the Examiner in charge of the application of Victor E. Schmiedeknecht, filed July 14, 1917, Pistons, Serial No. 180,511.

JAMES T. NEWTON,
Commissioner of Patents.

Case reconsidered as amended Dec. 3, 1917.

Applicant evidently has not read the sentence beginning on line 19, carefully since the use of "tend," in line 22, undoubtedly renders the sentence ungrammatical.

If "tend" be retained it will be necessary to insert "but" before "these".

The case is otherwise allowable.

DEPARTMENT OF THE INTERIOR
UNITED STATES PATENT OFFICE
Washington Dec., 28, 1917.

Victor E. Schmiedeknecht,

Sir: Your Application for a patent for an Improvement in Piston, filed July 14, 1917, has been examined and Allowed.

The final fee, Twenty Dollars, must be paid not later than Six Months from the date of this present notice of allowance. If the final fee be not paid within that period, the patent on this application will be withheld, unless renewed with an additional fee of $15, under the provisions of Section 4897, Revised Statutes.

The office delivers patents upon the day of their date, and on which their term begins to run. The printing, photolithographing, and engrossing of the several patent parts, preparatory to final signing and sealing, will require about four weeks, and such work will not be undertaken until after payment of the necessary fee.

When you send the final fee you will also send, Distinctly and Plainly Written, the name of the Inventor, Title of Invention, and Serial Number as Above Given, Date of Allowance (which is the date of this circular), Date of Filing, and, if assigned, the Names of the Assignees.

If you desire to have the patent issue to Assignees, an assignment containing a Request to that effect, together with the Fee for recording the same, must be filed in this office on or before the date of payment of final fee.

After issue of the patent uncertified copies of the drawings and specifications may be purchased at the price of Five Cents Each. The money should accompany the order. Postage stamps will not be received.

Final fees will Not be received from other than the applicant, his assignee or attorney, or a party in interest as shown by the records of the Patent Office.

Respectfully,

~~Thomas Ewing,~~

J. I. Newton,

Commissioner of Patents.

William B. Munnell,

UNITED STATES DISTRICT COURT
NORTHERN DISTRICT OF OHIO (EASTERN DIVISION)

Honorable Commissioner of Patents,
Washington, D. C.

Sir:

In compliance with the Act of February 18, 1922 (41 42 Stat. L. .....), you are advised that there was filed on the 29th day of September 19230, in this court an action, suit, or proceeding No. 3510 entitled

Name The Cleveland Trust Company Plaintiff
Address Cleveland, Ohio
Chrysler Corporation
Highland Park, Michigan

versus

Name The Simmons Manufacturing Company
Address 3405 Perkins Ave., Cleveland, Ohio
Sterling Products Corporation
2914 North Market St., St. Louis, Missouri
Defendant

brought upon the following patents:

Patent No.	Date of Patent.	Patentee.
1,092,870	April 14, 1914	Edward O. Spillman and Louis P. Mooers
1,402,309	Jan. 3, 1922	L. P. Mooers
1,153,902	Sept. 21, 1915	Gustave E. Franquist
~~1,473,233~~ 16,273 Reissue	~~Nov. 6, 1923~~ Feb. 23, 1926	H. & H. Machine Company Cleveland Trust Company
1,655,968	Jan. 10, 1928	Chrysler Corporation and Aluminum Co.
1,763,523	June 10, 1930	Cleveland Trust Company
1,256,265	Feb. 12, 1918	Victor E. Schmiedeknecht

Patent No.	Date of Patent.	Patentee.

In the above-entitled case the following decision has been rendered or decree issued:

In Witness Whereof I have affixed my hand this 29th day of Sept., 1930, at Cleveland, Ohio.

~~B. C. Murfin,~~
F. J. Denzler,
Clerk of said Court,
By Ruth Strain,
Deputy Clerk.

File Wrapper and Contents of Maynard Patent in Suit.

(Filed January 27, 1934.)

390

DEPARTMENT OF COMMERCE

UNITED STATES PATENT OFFICE

To all persons to whom these presents shall come, Greeting:

THIS IS TO CERTIFY that the annexed is a true copy from the records of this office of the File Wrapper and Contents, in the matter of the Letters Patent of Howard E. Maynard, Assignor, by Direct and Mesne Assignments, of one-half to Chrysler Corporation and one-half to Aluminum Company of America, Number 1,655,968, Granted January 10, 1928, for Improvement in Pistons.

IN TESTIMONY WHEREOF I have hereunto set my hand and caused the seal of the Patent Office to be affixed, at the City of Washington, this fourteenth day of January, in the year of our Lord one thousand nine hundred and thirty-three and of the Independence of the United States of America the one hundred and fifty-seventh.

THOMAS E. ROBERTSON,
Commissioner of Patents.

No. 15,556. U. S. Patent Office

PETITION

To the Commissioner of Patents:

Your petitioner, Howard E. Maynard, a citizen of the United States of America, residing at Detroit, (Post-office Address: #700 Calvert Avenue), in the County of Wayne, in the State of Michigan, prays that Letters Patent may be granted to him for the improvement in PISTONS, set forth in the annexed specification.

And he hereby appoints Whittemore, Hulbert & Whittemore, a firm composed of James Whittemore, Prescott M. Hulbert and Laurence J. Whittemore and William J. Belknap, of Detroit, Michigan, his attorneys, with full power of substitution and revocation, to prosecute this application, to make alterations and amendments therein, to sign the drawings, to receive the Patent, and to transact all business in the Patent Office connected therewith.

HOWARD E. MAYNARD.

(United States Documentary Stamp 25 Cents W.H.&W.)

SPECIFICATION.

To all whom it may concern:

BE IT KNOWN that I, Howard E. Maynard, a citizen of the United States of America, residing at Detroit, in the County of Wayne and State of Michigan, have invented certain new and useful improvements in PISTONS,

of which the following is a specification, reference being had therein to the accompanying drawings:

434467—2

15,556. 8443

Filed

The invention relates to pistons designed for use in internal combustion engines and has for its object the prevention of "pumping" of oil and the "freezing" due to excessive expansion. In the present state of the art it is usual to construct pistons with a cylindrical ring portion having a relatively large clearance with reference to the diameter of the cylinder, and a skirt portion more closely fitting the same and which holds the piston in proper alignment and prevents side slapping. To avoid sticking or freezing of this skirt, due to expansion, certain constructions of pistons have provided the skirt with a longitudinal slot therein to compensate for expansion, but there is one serious difficulty with all such constructions, viz., the tendency for the lubricating oil to work up beyond the skirt and rings and into the explosion chamber. This results in the formation of carbon and other difficulties incident thereto. With the present invention I have overcome this difficulty by arranging between the cylindrical ring portion and the skirt portion a continuous annular groove. This will receive the oil creeping past the skirt and permitting the same to drop back in the cylinder without providing any bridge for its passage to the ring portion. The result is that the cylinder will be fully lubricated, while the excess of lubricant will be scraped off by the lowermost piston rings into the annular groove, where it is permitted to drop back into the cylinder.

In the drawings:

Figure 1 is a perspective view of my improved construction;

—2— 434467—3

8444

Figure 2 is a transverse section thereof; and

Figure 3 is a similar view in plane at right angles to Figure 2.

A is the piston head having a depending cylindrical portion B grooved to receive the rings C and of a diameter to afford abundant clearance within the engine cyl-

inder. D is a skirt, which is preferably of a diameter to closely fit the cylinder. This skirt is itself discontinuous with the cylindrical portion B of the piston, being separated therefrom by a groove E, which extends completely around the same. The connection between the two parts is formed by webs F on diametrically opposite sides of the piston, said webs extending inward from the portion B and vertically downward and having formed integral therewith the bearings G for the wrist pin. These webs are connected to the skirt on their opposite vertical edges, but are not connected thereto either at top or bottom. Thus there are formed the recesses H surrounding the bearings G with segmental skirt portions on opposite sides thereof and an annular skirt portion below said segmental skirt portions. One of the sides of the skirt between the points of attachment of the webs thereto is longitudinally slitted, as indicated at I, and this slit compensates for expansion and permits the skirt to conform itself to the cylinder.

With the construction as described, when the piston is in operation, the lubricant upon the wall of the

cylinder is spread by the skirt portion of the piston and will be forced upward to the groove E at the upper end of the skirt. Further creeping is prevented by this groove and when the accumulation of oil is sufficient, it will drop back inside of the skirt. At no time is there a body of the oil adjacent to the piston rings and for this reason when the engine is upon suction stroke, any leakage past the ring cannot draw oil upward. As a further safeguard, the cylindrical portion B below the lowermost of the ring C is cut away to provide a further clearance, as indicated at J, this clearance being sufficient to prevent the bridging of the oil thereacross. Thus on each downward stroke of the piston, the lowermost ring will scrape all surplus oil from the surface of the cylinder and in the upward stroke the oil thus accumulated will pass through the groove E and downward. Any oil accumulating in the recesses H will follow down the webs F and there is no chance at any point for the accumulation of oil adjacent to the rings. (X)

What I claim as my invention is:

Per C
Per B
Insert C¹
Per A
Ricardo
view of
Ebbs

1. A piston comprising a cylindrical ring portion and a ~~split~~ cylindrical skirt portion forming a guide for the piston C¹, said portions being separated from each other by a continuous circumferential groove, web portions for connecting said cylindrical portion and skirt portion, and wrist pin bearings in said webs.

Per C
Per B
Insert C²
Per A
Cls 1

2. A piston comprising a cylindrical ring portion and a ~~split~~ cylindrical skirt portion forming a guide for the piston C², said portions being separated by a continuous annular slot passing completely therethrough, webs for connecting said skirt and ring portion, located within the inner diameter thereof, being attached to the skirt only at their opposite vertical edges and to the ring portion only at the top, and wrist pin bearings formed integral with said webs.

Per E

3 1E. A piston comprising a head having a cylindrical ring portion depending therefrom and a skirt portion arranged beneath said ring portion and separated therefrom by a continuous annular

Insert I¹

groove, (1) I¹ webs on diametrically opposite sides of the piston, extending inward from said cylindrical portion and vertically downward, the opposite edges of said webs being connected to the ~~segments of~~ said segmental portions of the skirt, ~~extending between said webs,~~ and said skirt having an annular portion below said segmental portions disconnected from the lower ends of said web.

4 23. A piston comprising a head having a depending cylindrical ring portion of relatively large clearance with respect to the diameter of the cylinder, and a skirt portion below said ring portion closely fitting said cyl-

inder and separated from the ring portion by a continuous annular groove, webs on diametrically opposite sides of said piston extending inward from said cylindrical

portion and downward parallel to each other, the opposite vertical edges of said webs being connected
Per E to ~~segmental portions of~~ the skirt ~~extending~~
" E ~~therebetween,~~ said skirt having an annular por-
Per E tion below said ~~segmental portions~~ webs disconnected from the lower ends of said webs and there being also provided a slit completely through the skirt from the lower to the upper end there-
Insert E¹ of, and wrist pin bearings carried by said webs. (Cl. 3-5)

5. A piston comprising a head portion, a cylindrical ring portion depending therefrom and a skirt portion arranged below said ring portion and separated therefrom by a continuous annular groove, said
Sub. B¹ cylindrical ring portion being reduced in diameter below the lowermost ring to provide a large clearance between the same and the cylinder, and webs connecting said cylindrical portion and skirt portion also carrying the wrist pin bearings.

434467—7
8448

In testimony whereof I affix my signature.

HOWARD E. MAYNARD.

OATH

State of Michigan, County of Wayne, ss:

HOWARD E. MAYNARD, the above named petitioner, being duly sworn, deposes and says that he is a citizen of the United States of America, and resident of Detroit, Wayne County, Michigan; that he verily believes himself to be the original, first and sole inventor of the improvement in Pistons, described and claimed in the annexed specifications; that he does not know and does not believe that the same was ever known or used before his invention or discovery thereof, or patented or described in any printed publication in any country before his invention or discovery thereof, or more than two years prior to this application, or in public use or on sale in the United States for more than two years prior to this application; that said invention has not been patented in any Country foreign to the United States on an application filed by him or his legal representatives or assigns more than twelve months prior to this application;

and that no application for patent on said improvement has been filed by him or his representatives or assigns in any country foreign to the United States.

HOWARD E. MAYNARD.

Subscribed and sworn to before me this 22nd of December, 1920.

JAMES P. BARRY,

(Notarial Seal) *Notary Public in and for Wayne County, Michigan.*

My Commission expires October 2/1921.

Sep 13 1921
U. S. Patent Office

IN THE UNITED STATES PATENT OFFICE

Div. 12, Room 322,
Howard E. Maynard,
Piston,
Filed Jan. 3, 1921,
Ser. No. 434,467.

Detroit, Mich., August 31, 1921.

Hon. Commissioner of Patents,
Washington, D. C.

Sir:

In the matter of the above entitled interference and with reference to Office Letter of April 9, 1921, amendment is hereby made as follows:

Claim 1, line 2, before "skirt" insert —*split*—.

Claim 2, line 2, before "skirt" insert —*split cylindrical*—.

REMARKS

Claim 1, as now amended, brings out applicant's skirt portion as split as distinguished from the Spillman construction. As this feature of applicant's device provides for taking care of the contraction and expansion of the piston, claim 1 is now believed to clearly and patentably differentiate from the reference. As ~~this~~ claim 5 was rejected on this same reference, the Examiner's attention is directed to the fact that this claim recites said cylindrical rim portion being reduced in diameter below the lowermost ring to provide a large clearance between

434467—10

the same and the cylinder. The Spillman *et al.* construction is entirely lacking in this respect and as this

clearance operates as a further safe-guard, being sufficient to prevent the bridging of the oil thereacross another and more favorable reconsideration of this claim is earnestly solicited.

Claim 2, as now amended, describes applicant's skirt portion as split and cylindrical and in this respect is believed to clearly avoid Ricardo whose corresponding portion is not cylindrical but is formed by the segments E. In view of the foregoing remarks and in the absence of more pertinent art an early allowance of the claims as now submitted, is earnestly solicited.

Respectfully submitted,

HOWARD E. MAYNARD,
By WHITTEMORE, HULBERT & WHITTEMORE,
Attorneys.

HOWARD E. MAYNARD,
Piston,
Filed January 3, 1921,
Serial No. 434,467.

Detroit, Michigan, January 23, 1922.

HON. COMMISSIONER OF PATENTS,
Washington, D. C.

B

Sir:

In the matter of the above entitled application and with reference to Office Letter of January 9, 1922, amendment is hereby made as follows:

Claim 1, line 2, before "split" insert —*cylindrical*—, and after "portion" add —*forming a guide for the piston*—

Claim 2, line 2, after "split" add —*cylindrical*—, and after "portion" add —*forming a guide for the piston*—

Chenard view of Hives (Br.)

Cancel claim 5 and add the following claims:

Insert C^3 B'. Per C Per E Per D

5. A piston comprising a cylindrical ring portion ~~C^3~~ and a guiding skirt portion ~~C^3~~ provided with a slot extending longitudinally across the face thereof and at ~~an~~ a slight angle to the vertical center line of the piston, and a wrist pin bearing integrally connected to said skirt portion.

cls. 5 Sub. C^4

6. A piston comprising a cylindrical portion adapted to engage the walls of a cylinder and provided with a slot extending longitudinally thereof and at an angle to the vertical center line of the piston, and a wrist pin bearing connected to said cylindrical portion.

434467—13

REMARKS

Claims 1 and 2 as amended now bring out applicant's split skirt portion as cylindrical and as forming a guide for the piston. There is clearly a distinction between forming a guiding skirt portion of perforated segments such as Ricardo shows, and in making the same cylindrical and split as applicant does. Ricardo's idea was to make the piston as light as possible and to this end, he uses two separate perforated segments or members. Clearly this reference would not teach applicant's novel idea above referred to. Claim 5 has been cancelled and new claims 5 and 6 substituted therefor. The Examiner's attention is particularly called to the subject matter of these added claims, which it is believed is of an entirely novel and patentable nature in piston construction. The novel feature of applicant's invention as brought out in these claims, consists in the forming of a slot extending longitudinally in a guiding skirt portion of a piston and at an angle to the vertical center line of the piston. The purpose of the slot, of course, is to provide for expansion and contraction and by forming it at an angle to the center line of the piston, applicant avoids wearing a narrow depression in the walls of the cylinder for the reason that in the reciprocation of the piston, this slot will present, with reference to the walls of the cylinder, a relatively broad surface. On the other

hand, if the slot were vertical, reciprocation of the piston would cause the wearing of a narrow groove in the walls of the cylinder. For the foregoing reason, the claims now presented are believed to be directed to clear-

434467—14

ly patentable subject matter and early formal allowance of the case is earnestly solicited.

Respectfully submitted,

HOWARD E. MAYNARD,

By: WHITTEMORE, HULBERT & WHITTEMORE,

Detroit, Mich.

Please find below a communication from the Examiner in charge of the application of Howard E. Maynard, Filed Jan. 3, 1921, Serial No. 434,467 PISTONS.

THOMAS E. ROBERTSON,
Commissioner of Patents.

Responsive to the amendment of Feb. 2, 1922.

Claims 1 and 2 are again rejected upon Ricardo, of record. Broadly speaking, Ricardo shows a cylindrical split skirt portion for the purpose of guiding the piston in the cylinder. The mere fact that applicant forms his guiding sections to extend over a larger area of the cylinder by reason of the fact that the gap between said sections is narrower than that shown by Ricardo would not involve invention as such a difference is one of degree only.

Claims 5 and 6 are rejected on

Spillman, 1,325,176, Dec. 16, 1919 (74-108-A).

The remaining claims stand allowed.

P. P. PIERCE,

Washington, D. C.

Sir:—

In the matter of the above entitled application and with reference to Office Letter of May 11, 1922, amendment is hereby made as follows:—

per E C¹	Claim 1, line 2 before —skirt— cancel "split" and after —piston— insert "*and cut away to form a longitudinally extending slit therein.*"
C²	Claim 2, line 2, before —cylindrical— cancel "split" and after —piston— add "*and cut away to form a longitudinally extending slit therein.*"

Claim 5, line 2, after —portion— insert

C³ per E "*separated from each other by a continuous circumferential groove, said skirt being*" and

same line, change —slot— to "*slit*"; line 3, before —thereof— insert "*across the face*" and change —an— to "*a slight.*"

Cancel claim 6 and substitute therefor:—

Cls 5 C⁴ per E 6. A piston comprising a cylindrical ring portion and a substantially cylindrical skirt portion forming a guide for the piston, said portions being separated from each other by a continuous circumferential groove and said skirt portion being provided with a narrow slit extending across one side thereof and at a slight angle to the vertical center line of the piston and integral web portions for connecting said cylindrical portions.

434467—17

Remarks

Claims 1 and 2 respectively have been amended to bring out applicant's cylindrical skirt portion as cut away to form a longitudinal slit therein. It is believed these claims now recite subject matter of a patentable nature differentiating from Ricardo of record, inasmuch as his disclosure would not suggest the forming of a cylindrical skirt portion and cutting the same away to form a longitudinally extending slit therein. The advantage of this feature over the disclosure of the reference is that applicant's skirt portion has a much greater circumferential contact with the walls of the cylinder and consequently practically eliminates any side slapping of the cylinder and at the same time this slit provides for contraction and expansion of said skirt portion. A further advantage in having the greater contacting surface with the cylinder walls is that the skirt will tend to wipe the greater amount of oil therefrom and thus lessen chance of oil passing up past the rings. For these reasons the claims as now presented are believed to be clearly allowable.

Claim 5 has been amended to bring out the cylindrical ring portion and guiding skirt portion as separated from each other by a continuous circumferential

434467—18

groove thus distinguishing from Spillman's disclosure wherein the groove extends only part way around the piston. This claim also brings out that applicant's slit extends across the face at a slight angle to the vertical center line of the piston. The advantage over Spillman's disclosure wherein the slots extend halfway around the piston on opposite sides thereof is that applicant's idea makes for a much stronger piston which will resist the stress thereon much better than the flimsy structure of the reference. Furthermore applicant's device is not only more durable but also provides for contraction and expansion equally as well by this slit which extends only at a slight angle to the vertical center line of the piston. New claim 6 is directed to similar subject matter and in view of the preceding remarks the same is believed to patentably differentiate from the reference.

A more favorable reconsideration and an early formal allowance of the claims now presented is respectfully solicited.

Respectfully submitted,

HOWARD E. MAYNARD,

By WHITTEMORE, HULBERT & WHITTEMORE,

Attorneys.

UNITED STATES PATENT OFFICE

Washington July 13, 1922

Whittemore, Hulbert & Whittemore,
Penobscot Bldg.,
Detroit, Michigan.

Please find below a communication from the EXAMINER in charge of the application of Howard E. Maynard, Filed Jan. 3, 1921, Serial No. 434,467 PISTONS.

THOMAS E. ROBERTSON,
Commissioner of Patents.

Amended May 29, 1922.

Claims 1 and 2 are again rejected upon Ricardo, of record and for the reasons therein stated.

Claims 5 and 6 are rejected upon

Ebbs, 700,309, May 20, 1902 (74-108-A),

in view of Spillman, of record.

In connection with claims 1 and 2 applicant's attention is invited to the fact that the structure shown by Ebbs consists of a piston having a cylindrical ring portion and a cylindrical split skirt portion, said portions being separated by continuous circumferential grooves and said portions being connected together and wrist pin bearings connected to the skirt portions by webs substantially as set forth by applicant.

The remaining claims stand allowed.

P. P. PIERCE,
Examiner.

Amendment D

IN THE UNITED STATES PATENT OFFICE

Amendment D
Div. 12, Room 322,
HOWARD E. MAYNARD,
Pistons,
Filed Jan. 3, 1921,
Ser. No. 434,467.

Detroit, Michigan, Aug. 14, 1922.

HON. COMMISSIONER OF PATENTS,
Washington, D. C.

Sir:

In the matter of the above entitled application and with reference to Office Letter of July 13, 1922, amendment is hereby made as follows:

Claim 5, line 5, after —bearing— insert "*integrally*".

Claim 6, line 8, before —web— insert "*integral*".

REMARKS:

The Examiner's ground for rejecting claims 1 and 2 upon Ricardo, is, that broadly speaking he shows a cylindrical split skirt portion for the purpose of guiding the piston in the cylinder. The Examiner further states, that the forming of applicant's guiding sections to extend over a larger area of the cylinder, by reason of the fact that the gap between said sections is narrower than that shown by Ricardo, would not involve invention as such

difference is one of degree only. Applicant respectfully suggests that even broadly considering Ricardo's segments as a split skirt portion although they occupy only one half of the inner circumference of the cylinder, this reference entirely fails to meet the recitation in claims 1 and 2, as now presented, namely, a cylindrical skirt portion forming a guide for the piston and *cut away* to form a longitudinally extending slit therein. There is a decided advantage in applicant's skirt portion construe-

tion over that of Ricardo's firstly in that his greater circumferential contact with the walls of the cylinder eliminates any chance of side slapping of the piston and secondly in that his skirt wipes the greater amount of oil from the cylinder wall thus minimizing the chance for oil to pass the rings. Ricardo's segments engaging substantially only one-half of the surface that applicant's skirt does is devoid of these advantages and certainly would not teach the novel idea of cutting a cylindrical skirt away to form a longitudinally extending slit therein. A more favorable reconsideration and allowance of claims 1 and 2, as now presented, is therefore respectfully requested.

Claim 5 has been amended to recite applicant's wrist pin bearing as integrally connected to his skirt portion obviously differentiating from the Ebbs' disclosure. There is no mention made of the wrist pin bearing in the Spillman disclosure and especially in view of figure 2 it would appear that the bearing shown is not integral.

434467—22

Claim 6 has also been amended to bring out applicant's cylindrical ring and skirt portions as connected by integral web portions as distinguished from Ebbs' construction wherein the rim portion is secured to the skirt portion by a detachable member d. Claim 6 which also recites applicant's slit extending across the face of the piston at a slight angle to the vertical center line of the piston is believed to recite subject matter patentably differentiating from the Spillman disclosure. Spillman's slits which extend half way around his piston on opposite sides thereof necessitates spot welding of the pointed end of the tongues and then grinding of the same down to a true cylinder. (See lines 4 to 15 inclusive page 2). Applicant's novel idea avoids this requirement and furthermore makes for a stronger and more durable piston at the same time possessing the desired advantages. It is believed the claims, as now submitted, are therefore drawn to patentable subject matter and an early formal allowance of the case is earnestly solicited.

Respectfully submitted,

HOWARD E. MAYNARD,

By: WHITTEMORE, HULBERT & WHITTEMORE,

Attorneys.

DEPARTMENT OF THE INTERIOR

UNITED STATES PATENT OFFICE

Ch-D Washington Oct. 5, 1922

Whittemore, Hulbert & Whitemore,
Penobscot Bldg.,
Detroit, Mich.

Please find below a communication from the Examiner in charge of the application of Howard E. Maynard, Filed Jan. 3, 1921, Serial No. 434,467 Pistons.

THOMAS E. ROBERTSON,
Commissioner of Patents.

Responsive to the amendment of Aug. 16, 1922.

Claims 1 and 2 are rejected as setting forth an unpatentable combination over Ebbs in view of Ricardo, both of record.

Relative to the above claims, applicant's attention is invited to the following considerations: the Ebbs structure discloses all of the basic structural features and combinations set forth by these claims, namely, in that it shows a piston comprising cylindrical ring and skirt portions, separated from each other by a continuous annular slot passing completely therethru, said skirt "being longitudinally slit and "web" portions" connecting the head and skirt and the wrist pin bearing being integral with the said "web". The additional limitations of "the webs being attached to the skirt only at their opposite vertical edges" and the statements to the effect that there are two wrist pin bearings, are shown to be old in the art by Ricardo, who includes these features in the same combination of features.

It is further to be noted that applicant's contribution to the art resides in the provision of an annular portion at the lower part of the piston skirt below the ex-

434467—24

434,467—2

posed gudgeon pin bosses. That is, in casting the guide slippers of Ricardo continuous below the webs and wrist pin bosses and then splitting the skirt on the thrust side. This feature forms the basis of patentability in the allowed claims, which are thought to completely cover applicant's invention.

Claims 5 and 6 are rejected on the

French patent to Chenard *et al.*, 468,595, Apr. 28, 1914 (74-108) (1 sheet),

in view of either

Schoengarth, 1,174,092, Mar. 7, 1916 (74-108-A),

or the

British patent to Hives *et al.*, 140,988, Apr. 8, 1920 (74-108-A) (1 sheet).

There being no invention in splitting the piston skirt shown by the French patent, *supra*, in the manner taught by the last named patents.

Upon viewing the allowed claims it is noted that "the segments of said skirt" referred to in claim 3 has no antecedent. This phrase is also held to be inaccurate, unwarranted and not applicable to the device disclosed and described by applicant. Applicant's piston skirt is an integral unitary structure and not divided into segments.

The above observations are equally applicable to the similar terms occurring in claim 4. In order that the prosecution of the case may be expedited without unnecessary delay, the examiner suggests that "segments of", in line 8, claim 3, should be canceled. Also in claim 4, lines 10 and 11 "segmental portions of", and "extending therebetween," respectively should be canceled. Same claim, line 12, "segmental portions," should be canceled and *webs* inserted in lieu thereof.

P. P. Pierce,
Examiner.

Div. 12, Room 322,
Howard E. Maynard,
Pistons,
Filed Jan. 3, 1921,
Serial No. 434,467.

Detroit, Mich., March 16, 1923.

Hon. Commissioner of Patents,
Washington, D. C.

Sir:—

In the matter of the above entitled application and with reference to Office Letter of October 5, 1922, amendment is hereby made as follows:—

Cancel claims 1 and 2.

Claim 3, line 8, cancel "segments of."

Claim 4, line 10, cancel "segmental portions of." Lines 10 and 11, cancel "extending therebetween." Line 12, cancel "segmental portions" and substitute —*webs*—.

Cancel claims 5 and 6.

Adjust the ordinals of the remaining claims and add:—

3. A piston comprising a head, a cylindrical skirt beneath said head and having recesses in diametrically opposite sides thereof, webs extending downwardly from said head upon diametrically opposite sides thereof and having the opposite side edges thereof connected to the side edges of the recesses in said skirt, whereby openings are provided

434467—26

8450

between the lower ends of said webs and said skirt, and wrist pin bearings carried by said webs.

4. 3 A piston comprising a head, a cylindrical skirt beneath said head having recesses in diametrically opposite sides thereof, parallel webs extending downwardly

from said head and having the opposite side edges thereof connected to the side edges of the recesses in
Per I said skirt, ~~whereby~~ **separating** openings ~~are~~ **being** provided between the lower ends of said webs and said skirt and between the upper edges of said skirt and said head, and wrist pin bearings carried by said webs.

5. A piston comprising a head, a cylindrical skirt beneath said head having recesses in diametrically opposite sides thereof, webs extending downwardly from said head and having the opposite side edges thereof connected to the side edges of the recesses in
Per I said skirt, whereby openings are provided between the lower ends of said webs and said skirt, and wrist pin bearings formed integral with said webs, one side of said skirt between the points of attachment of said webs thereto being slit longitudinally.

6. 4 A piston comprising a head having a depending cylindrical portion provided with annular grooves, rings engaging said grooves, the cylindrical portion below the lowermost ring being cut away, a cylindrical skirt beneath the cylindrical portion of said head and having recesses in diametrically opposite sides thereof, webs extending downwardly from said head and having the opposite side edges thereof connected to the side
Per I edges of the recesses in said skirt, ~~whereby~~ sep-
" I arating openings ~~are~~ being provided between the lower ends of said webs and said skirt, and wrist pin bearings carried by said webs, one side of said

skirt between the points of attachment of said webs thereto being slit longitudinally.

7. 5 A piston comprising a head, a cylindrical skirt beneath said head, parallel webs extending downwardly from said head and connected to said skirt
Per I ~~whereby~~ **separating** recesses ~~are~~ **being** provided between the lower ends of said webs and said skirt and between the upper ends of said skirt and said head, one side of said skirt between the points of attachment of said webs thereto being slitted longitudinally, and wrist pin bearings carried by said webs. **(X)**

REMARKS

Claims 1 and 3 (former claims 3 and 4) have been amended in accordance with the suggestions of the Examiner.

The references of record fail to show a cylindrical skirt beneath a piston head having recesses in diametrically opposite sides thereof together with webs extending downwardly from the piston head and having the opposite side edges thereof connected to the side edges of the recesses in said skirt, whereby openings are provided between the lower ends of said webs and said skirt as well as between the upper edges of said skirt and said head. This construction is defined in the new claims submitted above. The references of record also fail to show a head having a depending cylindrical portion provided with annular grooves adapted to receive the piston rings, said cylindrical portion below the lowermost ring being cut away.

Please find below a communication from the EXAMINER in charge of the application of Howard E. Maynard, Filed Jan. 3, 1921, Serial No. 434,467 Pistons.

THOMAS E. ROBERTSON,
Commissioner of Patents.

Amended March 19, 1923.

The following claims are suggested to the applicant for the purpose of interference:

—A piston comprising a head, a skirt separated at its periphery from the head, and pin bosses connected to the head and to the upper and lower parts of the skirt, said skirt being split longitudinally at one side between its connections to said bosses.

A piston comprising a head portion, a skirt portion, two separated pin bosses, connecting flanges in the zone of the bosses and extending from the bosses to the skirt on both sides of the bosses, connecting means from each of the bosses to the head portion, the skirt portion being entirely separated from the head portion except through the boss connections, and the skirt portion being split longitudinally of the piston to permit free expansion and contraction.

A piston comprising a head portion, a skirt portion, two separated pin bosses, connecting flanges in the zone of the bosses and extending from the bosses to the skirt on both sides of the bosses, connecting means from each of the bosses to the head portion, the skirt portion being entirely separated from the head portion except through the boss connections, and the skirt portion being split longitudinally of the piston to permit free expansion and contraction and the skirt portion being cut away adjacent the outer ends of the piston bosses.

A piston having a head portion with a ring groove therein, a skirt portion having its cylinder engaging part separated from the head portion, separated pin bosses having integral flanges connecting them with the skirt on

both sides of the bosses and with the head portion respectively, said skirt being split from top to bottom on one side only of the pin bosses to permit free expansion and

434467—30

434467—2

contraction of the skirt portion.

A piston for internal combustion engines comprising in combination a head portion having an end wall and a side wall, a guide portion having on one side a cylinder-engaging part disposed to take the angular thrust of a connecting rod during one stroke of the piston, said cylinder-engaging part being separated at its upper end from said side wall by an air gap and being split longitudinally to accommodate expansion incident to the heating of the piston a pair of separated pin bosses, and walls integrally uniting said bosses, the guide portion and the head portion.

A piston comprising a head and body, internal yielding ribs supporting the head and body, and means on said ribs adapted to form engaging connection with operable parts for said piston.

A piston open at one end and having a packing ring supporting portion and a cylinder engaging portion, said cylinder engaging portion having a slot which is cut through the thickness of its peripheral wall and extending from the open end of the piston to said ring supporting portion, a pair of wrist pin bearings depended from said ring supporting portion separated from said cylinder engaging portion, and tying means extending from each of said wrist pin bearings each being co-operably connected at their opposite ends to said cylinder engaging portion.

A piston having a head with top and side walls in combination with a guide structure connected thereto and comprising diametrically opposite cylinder-engaging parts formed with air spaces between their upper edges and the bottom edge of the side wall of the head, wrist pin bosses between the cylinder-engaging parts, and means joining said bosses and cylinder-engaging parts together, the said joining means being resiliently yieldable and arranged not to engage the cylinder.

A piston closed at one end and open at its opposite end, said piston having an annular cutting formed through the thickness of its peripheral wall thereby providing a separated sleeve-like skirt which is approximately cylinder bearing in its entirety, a pair of wrist pin bearings depended from said piston end and being

free from engagement with said skirt, supporting means extending from each of said bearings to said skirt, said skirt being provided with a longitudinal slot cut through the thickness of its wall and extending from the open end thereof to said annular cutting.

In a piston for an internal combustion engine, the combination of a head having ring grooves therein, a plurality of webs integral with said head and having diametrically opposite piston pin bosses therein, a skirt integral with said webs relieved adjacent said webs and separated from the head by circumferential slots and provided with a longitudinal slot connecting the lower end of the piston with one of the circumferential slots.

In a piston for an internal combustion engine the combination of a head comprising a head disc and a peripheral flange having ring grooves therein, a pair of

434467—31

434,467—3

cordal webs, substantially rectangular in shape and located opposite each other in the piston, connected integrally at their upper edges to the peripheral flange of the piston, diametrically opposite wrist pin bosses, one in each of said webs, a skirt for said piston integrally connected to each of the side edges of the webs and cut away so as to expose each of the rectangular webs and the piston pin bosses from the outside of the piston, said piston being provided with circumferential slots between the skirt and head and with a longitudinal slot extending from one of the circumferential slots to the open end of the piston.

Failure to make the above claims within thirty days from the date of mailing of this letter will be taken as a disclaimer of the subject matter covered thereby.

Detroit, Mich., April 21-1923.

Hon. Commissioner of Patents,
Washington, D. C.

Sir:—

In the matter of the above entitled application and with reference to Office Letter of April 5, 1923, amendment is hereby made as follows:—

Add the following claims:—

Per H 8. A piston comprising a head, a skirt separated at its periphery from the head, and pin bosses connected to the head and to the upper and lower parts of the skirt, said skirt being split F' longitudinally at one side between its connections to said bosses.

9. A piston comprising a head portion, a skirt portion, two separated pin bosses, connecting flanges in the zone of the bosses and extending from the bosses to the skirt on both sides of the bosses, connecting means from each of the bosses to the head portion, the skirt portion being entirely separated from the head portion except through the boss connections, and the skirt portion being split longitudinally of the piston to permit free expansion and contraction.

10. A piston comprising a head portion, a skirt portion, two separated pin bosses, connecting flanges in the

zone of the bosses and extending from the bosses to the skirt on both sides of the bosses, connecting means from each of the bosses to the head portion, the skirt portion being entirely separated from the head portion except

through the boss connections, and the skirt portion being split longitudinally of the piston to permit free expansion and contraction and the skirt portion being cut away adjacent the outer ends of the piston bosses.

11. A piston having a head portion with a ring groove therein, a skirt portion having its cylinder engaging part separated from the head portion, separated pin bosses having integral flanges connecting them with the skirt on both sides of the bosses and with the head portion respectively, said skirt being split from top to bottom on one side only of the pin bosses to permit free expansion and contraction of the skirt portion.

12. A piston for internal combustion engines comprising in combination a head portion having an end wall and a side wall, a guide portion having on one side a cylinder-engaging part disposed to take the angular thrust of a connecting rod during one stroke of the piston, said cylinder-engaging part being separated at its upper end from said side wall by an air gap and being split longitudinally to accommodate expansion incident to the heating of the piston a pair of separated pin bosses, and walls integrally uniting said bosses, the guide portion and the head portion.

13. A piston comprising a head and body, internal yielding ribs supporting the head and body, and means on said ribs adapted to form engaging connection with operable parts for said piston.

434467—34

14. A piston open at one end and having a packing ring supporting portion and a cylinder engaging portion, said cylinder engaging portion having a slot which is cut through the thickness of its peripheral wall and extending from the open end of the piston to said ring supporting portion, a pair of wrist pin bearings depended from said ring supporting portion and separated from said cylinder engaging portion, and tying means extending from each of said wrist pin bearings each being cooperably connected at their opposite ends to said cylinder engaging portion.

15. A piston having a head with top and side walls in combination with a guide structure connected thereto and comprising diametrically opposite cylinder-engaging parts formed with air spaces between their upper edges and the bottom edge of the side wall of the head, wrist pin bosses between the cylinder-engaging parts, and means joining said bosses and cylinder-engaging

parts together, the said joining means being resiliently yieldable and arranged not to engage the cylinder.

16. A piston closed at one end and open at its opposite end, said piston having an annular cutting formed through the thickness of its peripheral wall thereby providing a separated sleeve-like skirt which is approximately cylinder bearing in its entirety, a pair of wrist pin bearings depended from said piston end and being free from engagement with said skirt, supporting means extending from each of said bearings to said skirt, said skirt being provided with a longitudinal slot cut through the thickness of its wall and extending from the open end thereof to said annular cutting.

434467—35

17. In a piston for an internal combustion engine, the combination of a head having ring grooves therein, a plurality of webs integral with said head and having diametrically opposite piston bosses therein, a skirt integral with said webs relieved adjacent said webs and separated from the head by circumferential slots and provided with a longitudinal slot connecting the lower end of the piston with one of the circumferential slots.

18. In a piston for an internal combustion engine the combination of a head comprising a head disc and a peripheral flange having ring grooves therein, a pair of cordal webs, substantially rectangular in shape and located opposite each other in the piston, connected integrally at their upper edges to the peripheral flange of the piston, diametrically opposite wrist pin bosses, one in each of said webs, a skirt for said piston integrally connected to each of the side edges of the webs and cut away so as to expose each of the rectangular webs and the piston pin bosses from the outside of the piston, said piston being provided with circumferential slots between the skirt and head and with a longitudinal slot extending from one of the circumferential slots to the open end of the piston.

Please find below a copy of a communication from the Examiner concerning the application of Howard E. Maynard, Filed Jan. 3, 1921, Serial No. 434,467, Pistons.

Very respectfully,

THOMAS E. ROBERTSON,
Commissioner of Patents.

Room No. 322

Address only
The Commissioner of Patents
Washington, D. C.

49569

The case, above referred to, is adjudged to interfere with others, hereafter specified, and the question of priority will be determined in conformity with the Rules.

The statement demanded by Rule 110 must be sealed up and filed on or before Aug. 27, 1923, with the subject of the invention, and name of party filing it, indorsed on the envelope. The subject-matter involved in the interference is

Count.

1. A piston for internal combustion engines comprising in combination a head portion having an end wall and a side wall, a guide portion having on one side a cylinder-engaging part disposed to take the angular thrust of a connecting rod during one stroke of the piston, said cylinder-engaging part being separated at its upper end from said side wall by an air gap and being split longitudinally to accommodate expansion incident to the heating of the piston, a pair of separated pin bosses, and walls integrally uniting said bosses, the guide portion and the head portion.

The interference involves your application above identified and an application for Pistons, filed by Ray E. Day, of 3825 North 24th St., Tacoma, Wash., whose attorney is Clarence E. Mehlhope, of Marquette Bldg., Chicago, Ill.,

An application for Pistons, filed by George A. Taylor, of 164 Dana Avenue, Hyde Park, Mass., whose attorney is Macleod, Calver, Copeland and Dike, of Tremont Bldg., Boston, Mass.,

An application for Pistons, filed by Frank Jardine, of c/o The Aluminum Castings Co., Cleveland, Ohio, whose attorney is B. D. Watts, of 451 Lennox Bldg., East

434467—38

9th & Euclid Ave., Cleveland, Ohio, and whose assignee is the Aluminum Manufactures Inc., Cleveland, Ohio,

An application for Pistons, filed by Stephen D. Hartog, of 3219 Natural Bridge Ave., St. Louis, Missouri, whose attorney is Bippey and Kingsland, of The Rialto Bldg., St. Louis, Mo.,

An application for Internal Combustion Engine Pistons, filed by Elmer C. Long, of 1037 Main St., Quincy, Illinois, whose attorney is Herbert G. Fletcher, of 321 International Life Bldg., c/o Knight Bros., St. Louis, Mo., and

An application for Pistons, filed by Edward J. Gulick, of P. O. Box 553, Elkhart, Indiana, whose attorney is Milton Tibbetts, c/o Packard Motor Car Co., Detroit, Michigan, and whose assignee is the Cleveland Trust Company, of Cleveland, Ohio, a corporation of Ohio.

The relation of the count of the interference to the claims of the respective parties is as follows:

Count	Day	Gulick	Hartog	Jardine	Long	Maynard	Taylor
1	14	15	30	15	10	12	13.

DEPARTMENT OF THE INTERIOR
UNITED STATES PATENT OFFICE
Washington, D. C.

Whittemore, Hulbert & Whittemore,
Penobscot Bldg.,
Detroit, Michigan.

Please find below a copy of a communication from the Examiner concerning the application of Howard E. Maynard, Filed Jan. 3, 1921, Serial No. 434,467, PISTONS

Very respectfully,
THOMAS E. ROBERTSON,
Commissioner of Patents.

Room No. 322
Address only
The Commissioner of Patents
Washington, D. C.

49570

The case, above referred to, is adjudged to interfere with others, hereafter specified, and the question of priority will be determined in conformity with the Rules.

The statement demanded by Rule 110 must be sealed up and filed on or before Aug 27, 1923, with the subject of the invention, and name of party filing it, indorsed on the envelope. The subject-matter involved in the interference is

Count.

1. A piston comprising a head and body, internal yielding ribs supporting the head and body, and means on said ribs adapted to form engaging connection with operable parts for said piston.

This interference involves your application above identified and an application for PISTONS, filed by Ray E. Day, of 3825 North 24th St., Tacoma, Washington, whose attorney is Clarence E. Mehlhope, of Marquette Bldg., Chicago, Illinois,

An application for Pistons, filed by George A. Taylor, of 164 Dana Ave., Hyde Park, Mass., whose attorney is Macleod, Calver, Copeland & Dike, of Tremont Bldg., Boston, Mass.,

An application for Piston for an Internal Combustion Engine, filed by Elmer C. Long, of 4834 Beaubien St., Detroit, Michigan, whose attorney is Herbert G. Fletcher, of 1111 International Life Bldg., St. Louis, Missouri,

434467—41

434,467—2

An application for Pistons, filed by Frank Jardine, of c/o The Aluminum Castings Co., Cleveland, Ohio, whose attorney is B. D. Watts, of 451 Lennox Bldg., East 9th & Euclid Ave., Cleveland, Ohio, and whose assignee is the Aluminum Manufactures Inc., of Cleveland, Ohio,

An application for Pistons, filed by Stephen D. Hartog, of 3219 Natural Bridge Ave., St. Louis, Missouri, whose attorney is Rippey & Kingsland, of The Rialto Bldg., St. Louis, Missouri, and

An application for Pistons, filed by Edward J. Gulick, of P. O. Box 553, Elkhart, Indiana, whose attorney is Milton Tibbetts, of c/o Packard Motor Car Company, Detroit, Michigan, and whose assignee is The Cleveland Trust Company, of Cleveland, Ohio, a corporation of Ohio.

The relation of the count of the interference to the claims of the respective parties is as follows:

Count	Day	Gulick	Hartog	Jardine	Long	Maynard	Taylor
1	15	30	1	16	13	13	14.

The case, above referred to, is adjudged to interfere with others, hereafter specified, and the question of priority will be determined in conformity with the Rules.

The statement demanded by Rule 110 must be sealed up and filed on or before Aug 27 1923, with the subject of the invention, and name of party filing it, indorsed on the envelope. The subject-matter involved in the interference is

Count.

1. A piston open at one end and having a packing ring supporting portion and a cylinder engaging portion, said cylinder engaging portion having a slot which is cut through the thickness of its peripheral wall and extending from the open end of the piston to said ring supporting portion, a pair of wrist pin bearings depended from said ring supporting portion and separated from said cylinder engaging portion, and tying means extending from each of said wrist pin bearings each being co-operably connected at their opposite ends to said cylinder engaging portion.

This interference involves your application above identified and an application for PISTONS, filed by Ray E. Day, of 3825 North 24th St., Tacoma, Wash., whose attorney is Clarence E. Mehlhope, of Marquette Bldg., Chicago, Ill.,

An application for PISTONS, filed by George A. Taylor, of 164 Dana Ave., Hyde Park, Mass., whose attorney is Macleod, Calver, Copeland & Dike, of Tremont Bldg., Boston, Mass.,

An application for ENGINE PISTONS, filed by Albert Spillman, of 261 Payne Ave., North Tonawanda, New York, whose attorney is Geyer & Popp, of 619 Brisbane Bldg., Buffalo, N. Y.,

434,467—2

An application for PISTONS, filed by Frank Jardine, of c/o The Aluminum Castings Company, Cleveland, Ohio, whose attorney is B. D. Watts, of 451 Lennox Bldg., East 9th & Euclid Ave., Cleveland, Ohio, and whose assignee is the Aluminum Manufactures Inc., of Cleveland, Ohio;

An application for PISTON, filed by Elmer C. Long, of 1037 Main St., Quincy, Illinois, whose attorney is Herbert G. Fletcher, of International Life Bldg., St. Louis, Missouri, and

An application for PISTONS, filed by Edward J. Gulick, of P. O. Box 553, Elkhart, Indiana, whose attorney is Milton Tibbetts, of c/o Packard Motor Car Company, Detroit, Michigan, whose assignee is the Cleveland Trust Company, of Cleveland, Ohio, a corporation of Ohio.

The case, above referred to, is adjudged to interfere with others, hereafter specified, and the question of priority will be determined in conformity with the Rules.

The statement demanded by Rule 110 must be sealed up and filed on or before Aug. 27, 1923, with the subject of the invention, and name of party filing it, indorsed on the envelope. The subject-matter involved in the interference is

Count.

1. In a piston for an internal combustion engine, the combination of a head having ring grooves therein, a plurality of webs integral with said head and having diametrically opposite piston pin bosses therein, a skirt integral with said webs relieved adjacent said webs and separated from the head by circumferential slots and provided with a longitudinal slot connecting the lower end of the piston with one of the circumferential slots.

This interference involves your application above identified and an application for PISTONS, filed by Ray E. Day, of 3825 North 24th St., Tacoma, Wash., and whose attorney is Clarence E. Mehlhope, of Marquette Bldg., Chicago, Ill., and

An application for PISTONS, filed by Frank Jardine, of c/o Aluminum Castings Co., Cleveland, Ohio, whose attorney is B. D. Watts, of 451 Lennox Bldg., East 9th & Euclid Ave., Cleveland, Ohio, and whose assignee is the Aluminum Manufactures, Inc., of Cleveland, Ohio.

The case, above referred to, is adjudged to interfere with others, hereafter specified, and the question of priority will be determined in conformity with the Rules.

The statement demanded by Rule 110 must be sealed up and filed on or before Aug. 27, 1923, with the subject of the invention, and name of party filing it, indorsed on the envelope. The subject-matter involved in the interference is

Count.

1. In a piston for an internal combustion engine the combination of a head comprising a head disc and a peripheral flange having ring grooves therein, a pair of cordal webs, substantially rectangular in shape and located opposite each other in the piston, connected integrally at their upper edges to the peripheral flange of the piston, diametrically opposite wrist pin bosses, one in each of said webs, a skirt for said piston integrally connected to each of the side edges of the webs and cut away so as to expose each of the rectangular webs and the piston pin bosses from the outside of the piston, said piston being provided with circumferential slots between the skirt and head and with a longitudinal slot extending from one of the circumferential slots to the open end of the piston.

This interference involves your application above identified and an application for PISTONS, filed by Frank Jardine, of c/o Aluminum Castings Co., Cleveland, Ohio, whose attorney is B. D. Watts, of 451 Lennox Bldg., East 9th & Euclid Ave., Cleveland, Ohio, and whose assignee is the Aluminum Manufactures, Inc., of Cleveland, Ohio.

Filed Jan. 3, 1921
For Pistons

J. King Harness,
1211 Majestic Bldg.,
Detroit, Mich.

The following patent is added to the record:

Derby et al, 1,053,790, Feb. 18, 1913 (74-108-9)

Interference Nos. 49,573; 49,577; 49,576; 49,575; 49,569; 49,570; 49,571; 49,572; 49,582; and 49,589 in which this application was involved having terminated adversely to applicant, claims 8 to 15 inclusive, 17 and 18 constituting the issues thereof stand finally rejected in accordance with Rule 132.

Interference No. 49572 having been dissolved on Spillman et al and Ebbs of record together with Derby et al, cited, claim 16 stands rejected in accordance with the decision noted in connection with this interference.

The remaining claims are all rejected as setting forth nothing patentable over the various issues of the numerous interferences.

Washington June 11, 1926

Please find below a communication from the Examiner in charge of this application.

THOMAS E. ROBERTSON,
Commissioner of Patents.

Applicant: Howard E. Maynard
Ser. No. 434,467
Filed Jan. 3, 1921
For Pistons

J. King Harness,
1211 Majestic Bldg.,
Detroit, Michigan.

The following claims are suggested to the applicant for the purpose of interferences:

—In a piston for an internal combustion engine, the combination of a head, a plurality of webs integral with said head and having oppositely disposed wrist pin bosses mounted one in each web, a skirt integral with said webs relieved adjacent said webs to a point between the bosses and the end of the skirt, said piston being provided with circumferential slots between the piston

head and skirt and with a longitudinal slot connecting the open end of the skirt with one of the circumferential slots.

In a piston for an internal combustion engine, the combination of a head and a plurality of webs integral with said head, diametrically oppositely disposed wrist pin bosses, one mounted in each of said webs and integral therewith, a skirt integral with said webs, relieved adjacent said webs, said relieved portion terminating between the bosses and the end of the skirt, said piston being provided with circumferential slots between the piston head and skirt, with a longitudinal slot connecting the end of the skirt with one of said circumferential slots, and with other circumferential slots between the end of the webs and the open end of the skirt.

In a piston for an internal combustion engine, the combination of a head provided with a disc portion and a flange portion and with ring grooves in the flange portion, a pair of substantially rectangular shaped webs integral with and depending from the flange portion of the head, a pair of oppositely disposed wrist pin bosses mounted one in each of said webs, a cross rib in said head and integral with the disc portion and flanges of the head and with said web and piston pin bosses, a skirt for said piston extending below said webs and integrally connected to the side edges of each of said webs, said piston being provided with circumferential slots between the skirt and head, with a longitudinal slot connecting one of said circumferential slots with the bottom edge of the skirt and with circumferential slots between the lower edges of the webs and the adjacent portion of the skirt.

A piston for an internal combustion engine comprising a head, oppositely disposed walls depending from and connected at their upper ends to the head, bosses carried by the said walls out of direct contact with the head, and a skirt structure including two oppositely disposed bearing portions joined together by extensions below each of the said bosses and indirectly connected to the head by the said walls, the skirt structure being separated, by air gaps, from the head at its upper edge, and from the said walls below the bosses.

434467—74

434,467—2

A piston for an internal combustion engine comprising a head, oppositely disposed walls depending from and connected at their upper ends to the head, the walls

being depressed within the maximum diameter of the piston, bosses carried by the said walls out of direct contact with the head, and a skirt structure, including two oppositely disposed bearing portions joined together by extensions below each of the said bosses and indirectly connected to the head by the said walls, the skirt structure being separated, by air gaps, from the head at its upper edge, and from the said walls below the bosses.—

A piston for an internal combustion engine comprising an integral head and skirt, the said skirt consisting of oppositely disposed cylinder engaging bearing walls separated from the head by circumferential slots, a slot extending lengthwise of one of the said bearing walls, depressed walls connecting the said bearing walls, and other cylinder engaging walls connecting the first said bearing walls and separated from the said depressed walls by circumferential slots.—

Failure to make the above claims within thirty days from the date of mailing of this letter will be taken as a disclaimer of the subject matter covered thereby.

P. P. Pierce,
Examiner.

Applicant: Howard E. Maynard
Ser. No. 434,467
Filed Jan. 3, 1921
For Pistons

The case, above referred to, is forwarded to the Examiner of Interferences because it it is adjudged to inter-

fere with others, hereafter specified. The question o
priority will be determined in conformity with the Rules
The interference will be identified as No. 54092. On o
before Aug 24 1926 the statement demanded by rule
110 must be sealed up and filed, with the subject of in-
vention, and name of party filing it, indorsed on the
envelope. The subject-matter involved in the interfer-
ence is

Counts.

1. In a piston for an internal combustion engine, the combination of a head, a plurality of webs integral with said head and having oppositely disposed wrist pin bosses mounted one in each web, a skirt integral with said webs relieved adjacent said webs to a point between the bosses and the end of the skirt, said piston being provided with circumferential slots between the piston head and skirt and with a longitudinal slot connecting the open end of the skirt with one of the circumferential slots.

2. In a piston for an internal combustion engine, the combination of a head and a plurality of webs integral with said head, diametrically oppositely disposed wrist pin bosses, one mounted in each of said webs and integral therewith, a skirt integral with said webs, relieved adjacent said webs, said relieved portion terminating between the bosses and the end of the skirt, said piston being provided with circumferential slots between the piston head and skirt, with a longitudinal slot connecting the end of the skirt with one of said circumferential slots, and with other circumferential slots between the end of the webs and the open end of the skirt.

3. In a piston for an internal combustion engine, the combination of a head provided with a disc portion and a flange portion and with ring grooves in the flange portion, a pair of substantially rectangular shaped webs integral with and depending from the flange portion of the head, a pair of oppositely disposed wrist pin bosses mounted one in each of said webs, a cross rib in said head and integral with the disc portion and flanges of the head and with said web and piston pin bosses, a skirt for said piston extending below said webs and integrally connected to the side edges of each of said webs, said piston being provided with circumferential slots between the skirt and head, with a longitudinal slot connecting one of said circumferential slots with the bottom edge of

the skirt and with circumferential slots between the lower edges of the webs and the adjacent portion of the skirt.

4. A piston for an internal combustion engine comprising a head, oppositely disposed walls depending from and connected at their upper ends to the head, bosses carried by the said walls out of direct contact with the head, and a skirt structure including two oppositely dis-

434467—79

434,467—2

posed bearing portions joined together by extensions below each of the said bosses and indirectly connected to the head by the said walls, the skirt structure being separated, by air gaps, from the head at its upper edge, and from the said walls below the bosses.

5. A piston for an internal combustion engine comprising a head, oppositely disposed walls depending from and connected at their upper ends to the head, the walls being depressed within the maximum diameter of the piston, bosses carried by the said walls out of direct contact with the head, and a skirt structure including two oppositely disposed bearing portions joined together by extensions below each of the said bosses and indirectly connected to the head by the said walls, the skirt structure being separated, by air gaps, from the head at its upper edge, and from the said walls below the bosses.

6. A piston for an internal combustion engine comprising an integral head and skirt, the said skirt consisting of oppositely disposed cylinder engaging bearing walls separated from the head by circumferential slots, a slot extending lengthwise of one of the said bearing walls, depressed walls connecting the said bearing walls, and other cylinder engaging walls connecting the first said bearing walls and separated from the said depressed walls by circumferential slots.

This interference involves your application above identified and an application for Pistons, filed by Frank Jardine and Ferdinand Jehle of c/o Aluminum Manufactures, Inc., Cleveland, Ohio, whose attorney is Richey and Watts of 1983 Union Trust Bldg., Cleveland, Ohio, and whose assignee is the Aluminum Manufactures, Inc., of Cleveland, Ohio, a corporation of Delaware.

The relation of the counts of the interference to the claims of the respective parties is as follows:

Hon. Commissioner of Patents,
Washington, D. C.

(13 cls. in case)

Sir:— *Cancel claims 8 to 18 inclusive.*

In the matter of the above entitled application, and

and March 2, 1927, respectively, applicant begs to respectfully request that the office more specifically state its ground of rejection of claims 1 to 7. In other words, the mere rejection of these claims on the multiplicity of counts constituting the previously decided interferences is entirely insufficient for applicant to determine just what the Examiner has in mind. As far as counsel can determine, counts 1 to 7 are clearly patentable over the counts of all the previous interferences, and should be allowed forthwith. It is, however, believed, that the Examiner should apply claims 1 to 7 to the particular interferences or interference counts he has in mind in order that applicant might make an intelligent response.

Respectfully submitted,

MAYNARD,

By J. KING HARNESS,

Attorney.

THOMAS E. ROBERTSON,

Commissioner of Patents.

Applicant: Howard E. Maynard
Ser. No. 434,467
Filed Jan. 3, 1921
For Pistons

J. King Harness
1211 Majestic Bldg.,
Detroit, Michigan

Amended March 22, 1927.

Additional reference:

Schmiedeknecht, 1,256,265, Feb. 12, 1918 (74-108-8)

In claim 1 there is no antecedent for "segmental portions" in the tenth line of the claim.

Upon reconsideration claim 3 is rejected on Schmiedeknecht, cited, who discloses a piston comprising a head and a skirt with a web connecting oppositely bearing portions and with opening slots between the web and the cylindrical portion of the skirt below the web.

Claims 4, 6 and 7 are rejected as being functional, there being insufficient structure set up to perform the operations and functions indicated by the matter in the claims following "whereby."

Claim 5 is rejected as being unpatentable over Schmiedeknecht in view of Ebbs, of record. This claim is also rejected as being functional as insufficient structure is shown whereby the operations indicated in the latter part of the claim are performed.

The claims which are rejected upon the single ground of functionality, when amended to overcome this condition, will probably be allowed as they define a structure which is in accord with the issues of the interferences in which the applicant received a favorable decision.

Claims 1, 2 and 19 to 24 inclusive are allowed subject

434467—84

(This Action Must be Responded to Within Six Months.)

434,467—2

to the corrections of informal matters noted above.

P. P. Pierce,
Examiner.

} Amendment

Commissioner of Patents,
Washington, D. C.

Sir:

I In response to Office Action of October 19th, 1927.
Cancel claims 3 and 5

Claim 1, line 4, before "webs" insert *said skirt having a pair of spaced segmental portions.* Same claim, line 8, before "skirt" insert *segmental portions of the.* Same line, cancel "extending between said webs." Same claim, next to the last line, change "portion" to *portions.*

Claims 4, 6 and 7, lines 6, 9 and 4 respectively, change "whereby" to *separating.*

Claims 4, 6 and 7, lines 7, 10 and 4 respectively, change "are" to *being.*

REMARKS

The rejected claims have been cancelled and the formal objections to claims 1, 4, 6 and 7 have been remedied so that the case is now in condition for allowance.

Respectfully submitted,

J. KING HARNESS,

Attorney for Applicant.

Dated November 7th, 1927,
c/o Chrysler Corporation,
Detroit, Michigan.

DEPARTMENT OF COMMERCE

UNITED STATES PATENT OFFICE

Washington

November twenty-five, 1927

Howard E. Maynard, Assors. etc.

Your Application for a patent for an Improvement in Pistons filed Jan. 3, 1921 has been examined and Allowed with 11 claims.

The final fee, Twenty Dollars, With $1 Additional for Each Claim Allowed in Excess of 20, must be paid not later than Six Months from the date of this present notice of allowance. If the final fee be not paid within that period, the patent will be withheld, but the applica-

tion may be renewed within one year after the date of the original notice with a renewal fee of $20 and $1 additional for each claim in excess of 20.

The office delivers patents upon the day of their date, on which date their term begins to run. The preparation of the patent for final signing and sealing will require about four weeks, and such work will not be begun until after payment of the necessary final fee.

When the final fee is paid, there should also be sent, Distinctly and Plainly Written, the name of the Inventor, Title of the Invention, and Serial Number as Above Given, Date of Allowance (which is the date of this circular), Date of Filing, and, if assigned, the Names of the Assignees.

If it is desired to have the patent issue to an Assignee or Assignees, an assignment containing a Request to that effect, together with the Fee for recording the same, must be filed in this office on or before the date of payment of the final fee.

After issue of the patent, uncertified copies of the drawings and specifications may be purchased at the price of Ten Cents Each. The money should accompany the order. Postage stamps will not be received.

The final fee will Not be received from other than the applicant, his assignee or attorney, or a party in interest as shown by the records of the Patent Office.

Notice.—When the Number of Claims Allowed is in Excess of 20, no Sum Less than $20 Plus $1 Additional for Each Claim in Excess of Twenty Can Be Accepted as the Final Fee.

Respectfully,

THOMAS E. ROBERTSON,
Commissioner of Patents.

J. King Harness
1211 Majestic Bldg.,
Detroit, Michigan

☞In Remitting the Final Fee Give the Serial Number at the Head of this Notice.

☞Uncertified Checks Will Not Be Accepted.

December 13th, 1927

Commissioner of Patents,
Washington, D. C.

Sir:

I hand you herewith check for twenty dollars ($20.00) in payment of the final fee in the application of Howard E. Maynard for Pistons, Serial No. 434,467, Filed January 3, 1921, allowed November 25, 1927, and assigned to Chrysler Corporation.

It is hoped that the patent may now be issued at an early date.

Very truly yours,

J. KING HARNESS,
Patent Counsel.

Applicant H. E. Maynard,
Ser. No. 434,467,
Filed Jan. 3, 1921,
For Pistons.

In accordance with the provisions of Order No. 2308, dated March 12, 1917, which reads in part as follows:

* * * * * *

> Obvious informalities in the application may be corrected by the examiner, but said correction must be in the form of an amendment, approved by the Principal Examiner in writing, placed in the file, and made a part of the record. The changes specified in the amendment will be entered by the clerk in the regular way.

* * * * * *

the changes, hereinafter specified, are made by the examiner in the application above identified.

Should these changes not be satisfactory to the applicant, appropriate amendment may be proposed under the provisions of Rule 78, provided the specification has not been printed.

The application has been amended as follows:

K

In claim 9, line 5, "jointed" has been changed to *joined*.

In claim 6, line 2, "*disposed*" has been inserted after "oppositely."

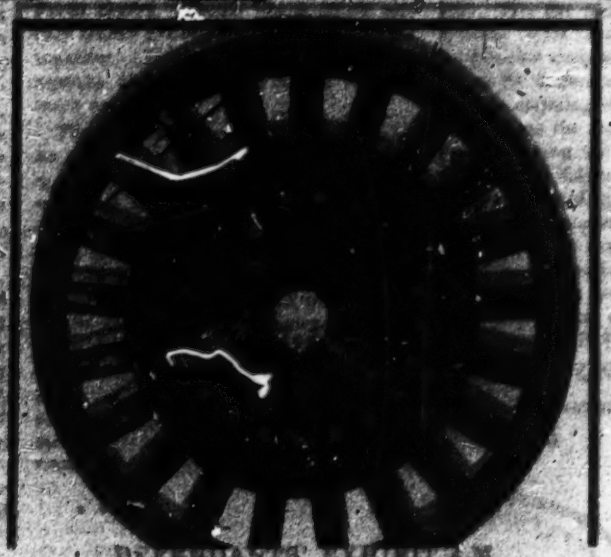
Mathieson Spring Wheels.

The latest announcement in the line of spring wheels comes from the Mathieson Spring Wheel Co., 200 Grand avenue, Chicago, Ill. The wheels are made with an unusually large number of spokes, each containing a spring and plunger.

The spring plungers all press against a central disc which is clamped between the hub flanges, so that the weight is entirely supported by the springs which offer a yielding support in any direction in the plane of the wheel.

Distortion of the wheel out of its proper plane is prevented by large plates which are bolted on diagonal short axle, making a sliding joint between the outer portion, which is supported directly by the tire, and the inner portion, which is rigidly connected. The wheel mechanism is packed in grease so that it is well lubricated and noiseless.

Another model, apparently good for driving wheels, has the spring plungers making contact with, but not connected to, pressure members which are situated in the central disc, the latter member then



DEFENDANT'S EXHIBIT 4-M.
Page 588 of "The Horseless Age" for April 8, 1914.
(Filed January 27, 1934.)

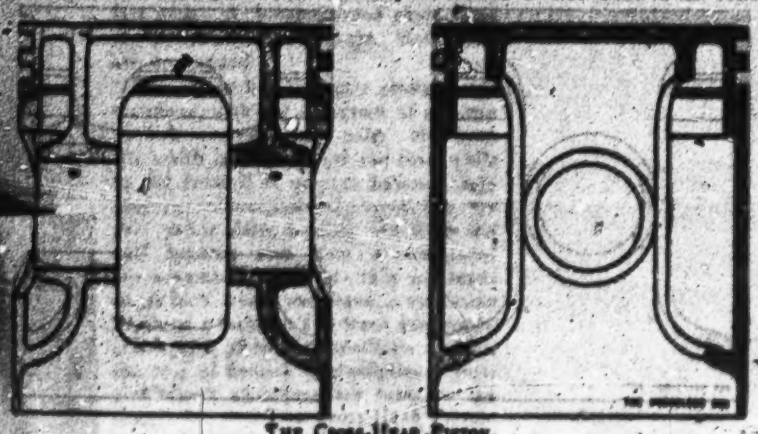
in the style shown. Solid tires are used with these wheels, and riding qualities equal or superior to pneumatic tires are claimed.

Herschell-Spillman Cross-Head Piston.

The present cross-head type of piston is a new device in which considerable interest has developed within the last few months. Arrangements have now been made whereby the Herschell-Spillman Co., North Tonawanda, N. Y., will manufacture this design of piston for the use of other engine builders.

As the name indicates, the piston head, containing also the packing rings, is separated from the skirt or crosshead portion of the piston, yet they are connected in one unit. Gooseneck rods containing the piston pin bosses connect the two portions.

The main advantage of the new type of piston is that the great heat of the piston head is not allowed to follow



THE CROSS-HEAD PISTON.

down the piston wall and cause expansion and distortion. The hole air gap prevents this, and the ring set is practically free, distorting part of the heat and transferring the rest to the lower portion of the crosshead, where it is absorbed and transferred to the water jacket without distortion.

It has been found that the cross-head in a 4-inch cylinder will run without slap if it is .0005 smaller than the cylinder bore, and that it will not cause trouble if it is only .001 under size, thus giving much greater working faces than in the conventional construction. Of course, the ring faces can be given only as great a clearance as desired without affecting the quietness of the engine.

It is said that the character of the crank case oil shows less lacquer than with ordinary pistons; also that carbonization on the piston head is much less. Increased weight seems to be the only objection which can be urged, and that is stated to be inconsiderable. A Herschell-Spillman 4-inch piston of ordinary type, with 3½-inch piston pin hole weighs 21 ounces, while the cross-head type weighs 24 ounces.

DEFENDANTS' EXHIBIT 4-Y.

Bill of Complaint and Answer in Case No. 27-32 in the U. S. District Court for the Southern District of New York, The Cleveland Trust Company vs. The National Piston Company, Inc.

(Filed January 27, 1934.)

UNITED STATES OF AMERICA,
SOUTHERN DISTRICT OF NEW YORK, ss.

I, CHARLES WEISER, Clerk of the District Court of the United States for the Southern District of New York do hereby certify that the writings annexed to this certificate have been compared with their originals on file and remaining of record in this office; that they are correct transcripts therefrom and of the whole of the said originals.

IN TESTIMONY WHEREOF I have hereunto subscribed my name and affixed the seal of the said Court at the City of New York, in the Southern District of New York, this 27th day of January in the year of our Lord one thousand nine hundred and thirty-three and of the Independence of the United States the One Hundred and fifty-seventh.

CHARLES WEISER,
Clerk.

(Seal)

IN THE UNITED STATES DISTRICT COURT
IN AND FOR THE SOUTHERN DISTRICT OF NEW YORK

THE CLEVELAND TRUST COMPANY,
Plaintiff,
vs.
THE NATIONAL PISTON COMPANY, INCORPORATED,
Defendant.
} IN EQUITY No. 27-32

BILL OF COMPLAINT.

To the Honorable Judges of the United States District Court for the Southern District of New York:

The Cleveland Trust Company, a corporation organized and existing under and by virtue of the laws of the State of Ohio, and having its principal office and place

of business at Cleveland in said State, brings this bill of complaint against The National Piston Company, Incorporated, a corporation organized and existing under and by virtue of the laws of the State of New York, having a regular established place of business at New York City in the State of New York, within the aforesaid Southern District of New York, and thereupon your Orator complains and says:

I.

That your Orator, The Cleveland Trust Company, is a corporation duly organized and existing under and by virtue of the laws of the State of Ohio, and has its principal office and place of business in Cleveland in said State.

II.

That the defendant, The National Piston Company, Incorporated, is a corporation duly organized and existing under and by virtue of the laws of the State of New York, and has a regular established place of business and principal office at New York City in the State of New York, within the aforesaid Southern Judicial District of New York, where it has committed and is threatening to continue to commit the acts of infringement hereinafter set forth.

III.

That the jurisdiction of the court in this cause is based upon the fact that the suit is one touching patent rights, and is brought to restrain infringement of certain Letters Patent owned by the plaintiff, and for an accounting of profits and damages arising from past infringement of said Letters Patent by the defendant.

IV.

That heretofore and before the 18th day of July, 1913, Edward O. Spillman and Louis P. Mooers, citizens of the United States, residing in the County of Niagara, State of New York, were the original, first and joint inventors of certain new and useful improvements in Pistons for Explosion Engines or Motors, fully described in Letters Patent of the United States No. 1,092,870, hereinafter mentioned, which invention or improvement was not known or used by others in this country, or pat-

ented or described in any printed publication in this or any foreign country, prior to their invention thereof, or more than two years prior to their application for said Letters Patent, and had not been in public use or on sale in this country for more than two years prior to said application, and had not been abandoned to the public, and had not been patented or caused to be patented by them or their legal representatives or assigns in any foreign country upon an application filed more than twelve months prior to the filing of their application for Letters Patent of the United States therefor; that the said Edward O. Spillman and Louis P. Mooers made due application to the Commissioner of Patents of the United States in accordance with the then existing acts of Congress, for Letters Patent of the United States for said invention or improvement, and having in all respects complied with the conditions and requisitions of said acts of Congress, on the 14th day of April, 1914, Letters Patent of the United States No. 1,092,870, signed, sealed and executed in due form of law for the said invention or improvement were issued and delivered unto said Edward O. Spillman and Louis P. Mooers, whereby there was secured unto them, their successors and assigns for the term of seventeen years from the said 14th day of April, 1914, the sole and exclusive right to make, use and sell to others to be used, throughout the United States and the territories thereof the aforesaid invention or improvement, all as by said Letters Patent, or a duly authenticated copy thereof in Court to be produced and shown unto your Honors, will more fully and at large appear.

V.

That subsequent to the granting of the aforesaid Letters Patent The Herschel-Spillman Company, a corporation of the State of New York, acquired an interest in said invention and Letters Patent from the said Edward O. Spillman, and that thereafter and on or about the 16th day of June, 1916, the said Edward O. Spillman and the said The Herschel-Spillman Company, by an instrument in writing duly executed and delivered and duly recorded in the Patent Office of the United States, in Liber R-101, page 1 of the Transfers of Patents, assigned, and transferred an undivided one-half of the entire right, title and interest in and to said Letters Patent No. 1,092,870 to one George B. Pitts; and that there-

after and on or about the 3rd day of July, 1919, the said George B. Pitts by an instrument in writing assigned said undivided one-half of the entire right, title and interest in, to and under said Letters Patent No. 1,092,870, to your Orator, The Cleveland Trust Company, which assignment was duly recorded on the 28th day of July, 1919, in Liber Q-107, page 336 of the Transfers of Patents; and that the said Louis P. Mooers on the 10th day of July, 1919, by an instrument in writing assigned an undivided one-half of the entire right, title and interest in, to and under said Letters Patent No. 1,092,870 to your Orator, The Cleveland Trust Company, which assignment was duly recorded on the 28th day of July, 1919, in Liber Q-107, page 339 of the Transfers of Patents; whereby your Orator became vested with and holds the entire right, title and interest in, to and under said Letters Patent No. 1,092,870, as will more fully and at large appear upon production in Court of the assignments aforesaid.

VI.

That heretofore and before the 22nd day of October, 1913 Jesse G. Vincent, a citizen of the United States, and resident of Detroit, Wayne County, State of Michigan, was the original, first and true inventor of certain new and useful improvements in Pistons, fully described in Letters Patent of the United States No. 1,279,184, hereinafter mentioned, which invention or improvement was not known or used by others in this country, or patented or described in any printed publication in this or any foreign country, prior to his invention thereof, or more than two years prior to his application for said Letters Patent; had not been in public use or on sale in this country for more than two years prior to said application; had not been abandoned to the public, and had not been patented or caused to be patented by him or his legal representatives or assigns in any foreign country upon an application filed more than twelve months prior to the filing of his application for Letters Patent of the United States therefor; that the said Jesse G. Vincent made due application to the Commissioner of Patents of the United States in accordance with the then existing acts of Congress, for Letters Patent of the United States for said invention and improvement, and by an instrument in writing duly executed and delivered by him, and duly recorded in the Patent Office of

the United States, assigned and transferred the entire right, title and interest in and to said invention and improvement and in and to said application for Letters Patent to Packard Motor Car Company, a corporation organized and existing under the laws of the State of Michigan, and authorized and requested the Commissioner of Patents to issue the Letters Patent upon said application and for the said invention and improvement to the said Packard Motor Car Company, and having in all respects complied with the conditions and requisitions of said acts of Congress, on the 7th day of September, 1918, Letters Patent of the United States No. 1,279,184, signed, sealed and executed in due form of law for the said invention and improvement were issued and delivered unto said Packard Motor Car Company, as assignee of the said Jesse G. Vincent, whereby there was secured unto said Packard Motor Car Company and its successors and assigns for the term of seventeen years from the said 17th day of September, 1918, the sole and exclusive right to make, use and vend to others to be used, throughout the United States and the territories thereof the aforesaid invention and improvement; all as by said Letters Patent, or a duly authenticated copy thereof in Court to be produced and shown unto your Honors, will more fully and at large appear.

VII.

That subsequent to the granting of the aforesaid Letters Patent, namely on or about the 11th day of September, 1922, by an instrument in writing said Packard Motor Car Company assigned the entire right, title and interest in, to and under said Letters Patent of the United States No. 1,279,184 to your Orator, The Cleveland Trust Company, which assignment was duly recorded on the 18th day of September, 1922, in Liber W-117, page 44 of the Transfers of Patents; whereby your Orator became vested with and holds the entire right, title and interest in, to and under said Letters Patent No. 1,279,184 as will more fully and at large appear upon production in Court of the assignment aforesaid.

VIII.

That heretofore and before the 11th day of May, 1916, Harold D. Church, a citizen of the United States and a resident of Detroit, Wayne County, State of Michi-

gan, was the original, first and true inventor of certain new and useful improvements in Hydro-Carbon Motor, fully described in Letters Patent of the United States No. 1,327,147, hereinafter mentioned, which invention or improvement was not known or used by others in this country, or patented or described in any printed publication in this or any foreign country, prior to his invention thereof, or more than two years prior to his application for said Letters Patent, and had not been in public use or on sale in this country for more than two years prior to said application; had not been abandoned to the public; and had not been patented or caused to be patented by him or his legal representatives or assigns in any foreign country upon an application filed more than twelve months prior to the filing of his application for Letters Patent in the United States therefor; that the said Harold D. Church made due application to the Commissioner of Patents of the United States in accordance with the then existing acts of Congress for Letters Patent of the United States for said invention and improvement, and by an instrument in writing duly executed and delivered by him, and duly recorded in the Patent Office of the United States, assigned and transferred the entire right, title and interest in and to said invention and improvement and in and to said application for Letters Patent to Packard Motor Car Company, a corporation organized and existing under the laws of the State of Michigan, and authorized and requested the Commissioner of Patents to issue the Letters Patent upon said application and for said invention and improvement to the said Packard Motor Car Company, and having in all respects complied with the conditions and requisitions of said acts of Congress, on the 6th day of January, 1920, Letters Patent of the United States No. 1,327,147, signed, sealed and executed in due form of law for the said invention and improvement were issued and delivered unto said Packard Motor Car Company, as assignee of said Harold D. Church, whereby there was secured unto said Packard Motor Car Company and its successors and assigns for the term of seventeen years from the 6th day of January, 1920, the sole and exclusive right to make, use and vend to others to use throughout the United States and the territories thereof, the aforesaid invention and improvement; all as by said Letters Patent, or a duly authenticated copy thereof in Court to be produced and shown unto your Honors, will more fully and at large appear.

IX.

That subsequent to the granting of the aforesaid Letters Patent, namely on or about the 11th day of September, 1922, by an instrument in writing, said Packard Motor Car Company assigned the entire right, title and interest in, to and under said Letters Patent of the United States No. 1,327,147 to your Orator, The Cleveland Trust Company, which assignment was duly recorded on the 18th day of September, 1922, in Liber C-117 page 64 of the Transfers of Patents; whereby your Orator became vested with and holds the entire right, title and interest in, to and under said Letters Patent No. 1,327,147, as will more fully and at large appear upon production in Court of the assignment aforesaid.

X.

That heretofore and before the 2nd day of June, 1917, Louis P. Mooers, a citizen of the United States, residing at Cincinnati, Hamilton County, State of Ohio, was the original, first and true inventor of certain new and useful improvements in Pistons for Internal Combustion Motors, fully described in Letters Patent of the United States No. 1,402,309, hereinafter mentioned, which invention or improvement was not known or used by others in this country, or patented or described in any printed publication in this or any foreign country, prior to his invention thereof, or more than two years prior to his application for said Letters Patent, had not been in public use or on sale in this country for more than two years prior to said application; had not been abandoned to the public, and had not been patented or caused to be patented by him or his legal representatives or assigns in any foreign country upon an application filed more than twelve months prior to the filing of his application for Letters Patent of the United States, therefor; that the said Louis P. Mooers made due application to the Commissioner of Patents of the United States in accordance with the then existing acts of Congress, for Letters Patent of the United States for said invention and improvement and by an instrument in writing duly executed and delivered by him and duly recorded in the Patent Office of the United States in Liber P-103 page 133 of the Transfers of Patents, assigned an undivided one half of the entire right, title and interest in and to said invention and improvement and in and to said application for Letters Patent to George B. Pitts of Cleveland, Ohio, and

authorized and requested the Commissioner of Patents to issue the Letters Patent upon said application and for said invention and improvement to said George B. Pitts and Louis P. Mooers; and thereafter, by instruments in writing duly executed and delivered and duly recorded in the Patent Office of the United States, the said George B. Pitts and Louis P. Mooers assigned and transferred unto your Orator, The Cleveland Trust Company, the entire right, title and interest in and to said invention and application for Letters Patent, and authorized and requested the Commissioner of Patents to issue the Letters Patent upon said application and for said invention to said The Cleveland Trust Company, pursuant to which said assignment the aforesaid Letters Patent No. 1,402,309, signed, sealed and executed in due form of law, for the said invention and improvement, were issued and delivered unto your Orator, The Cleveland Trust Company, on the 3rd day of January, 1922, whereby there was secured unto your Orator and its successors and assigns, for the term of seventeen years from the said 3rd day of January, 1922, the sole and exclusive right to make, use and sell to others to be used, throughout the United States and the territories thereof, the aforesaid invention and improvement, all as by said Letters Patent or a duly authenticated copy thereof, in court to be produced and shown unto your Honors, will more fully and at large appear.

XI.

And your Orator further avers and shows unto your Honors that the said defendant, The National Piston Company, Incorporated, as your Orator is informed and believes, having due and timely notice of said Letters Patent of the United States, and each of them, and well knowing the premises and the exclusive rights and privileges as aforesaid secured to your Orator by the said Letters Patent, but contriving and planning to injure your Orator and deprive it of the profits, benefits and advantages which would have otherwise accrued to your Orator from the said Letters Patent, has been since the grant of each of the Letters Patent aforesaid, and still is in the said Southern District of New York, unlawfully, wrongfully, and without license or permission of your Orator, manufacturing or causing to be manufactured, using and selling Pistons constructed according to and containing the aforesaid inventions, discoveries or improvements patented by said Letters Patent in vio-

lation and infringement of the aforesaid exclusive rights and privileges of your Orator, and has threatened to continue such infringing acts by making, using and selling Pistons in violation and infringement of your Orator's exclusive rights and privileges under said Letters Patent and to your Orator's great and irreparable loss and damage and contrary to equity and good conscience and to the manifest injury of your Orator in the premises.

XII.

That your Orator has caused notice to be given to the defendant of this aforesaid infringement of said Letters Patent, and each of them, and of the rights of your Orator in the premises, and requested the defendant to desist from such infringement; but that it has disregarded said notice and request and is continuing such infringement of said Letters Patent as aforesaid;

And forasmuch as your Orator can have no adequate relief except in this Court, and to the end therefor that the defendant may, if it can, shew cause why your Orator should not have the relief hereinafter prayed, and may make full disclosure of all the matters aforesaid, your Orator prays

1. That the said defendant, The National Piston Company, Incorporated, may be required to appear and [redacted] full, true, direct and perfect answer to the matters heretofore stated and charged, but not under oath, answer under oath being expressly waived.

2. That the said defendant, The National Piston Company, Incorporated, may be compelled to account for and pay over to your Orator the gains and profits which it has made and received, or shall have made and received, from said violation of your Orator's rights and from said infringement of the aforesaid Letters Patent, and each of them, and that your Honors may assess or cause to be assessed under your direction, in addition to the gains and profits to be accounted for by the defendant, the damages your Orator has sustained by reason of said infringement, and that your Honors may increase the actual damages to a sum equal to three times the amount of said assessment under the circumstances of the willful and unjust infringement of your Orator's Letters Patent by the said defendants as aforesaid.

3. That your Honor may grant unto your Orator a preliminary and also a perpetual writ of injunction, issuing out of and under the seal of this Honorable Court,

and directed to the said The National Piston Company, Incorporated, and enjoining it and its officers, agents, servants, attorneys and workmen and each of them, from making, using or vending or causing to be made, used or vended, or in any wise counterfeiting or imitating the inventions and improvements described and claimed in the aforesaid Letters Patent, or any part thereof, and from making, using or vending to others to be used or causing to be made, used or vended to others to be used, any Pistons, or any parts thereof, made in accordance with said Letters Patent, or any parts thereof, or like or similar to Pistons and parts thereof which the defendant has heretofore made and vended to others in violation of the rights of your Orator as aforesaid, and from any manner infringing said Letters Patent, or any of them, and that the Pistons and parts thereof embodying said patented inventions and improvements, or any part thereof, now in possession of the defendant or its agents or representatives, may be destroyed or delivered up to your Orator for that purpose.

4. That the said defendant, The National Piston Company, Incorporated, may be decreed to pay the costs of this suit, and that your Orator may have such other and further relief as the equity of the case may require and to your Honors may seem meet.

And may it please your Honors to grant unto your Orator a writ of injunction conformable to the prayer of this bill, and also a writ of subpoena of the United States of America, directed to the said The National Piston Company, Incorporated, commanding it to appear and make answer unto this bill of complaint and to abide and conform to such order and decree in the premises as to the Court shall seem meet and be required by the principles of equity and good conscience.

And your Orator will ever pray.

THE CLEVELAND TRUST COMPANY,
By F. H. HOBSON,
Vice-President.

Attest:

A. J. PEIFLER,
Ass't Trust Officer.

ROUNDS, SCHURMAN & DWIGHT,

EDWARD RECTOR,
Of Counsel.

STATE OF OHIO,
COUNTY OF CUYAHOGA, ss.

On this 17th day of July, 1923, before the undersigned, a Notary Public within and for the County and State aforesaid, personally appeared F. H. HOBSON and made oath that he is the Vice President of The Cleveland Trust Company, the above named complainant, that he has read the foregoing Bill of Complaint, and knows the contents thereof, and that the same is true, except as to those matters stated on information and belief, and as to those matters he believes it to be true.

ROY F. HAGGETT,
Notary Public.

(Seal)

IN THE UNITED STATES DISTRICT COURT
IN AND FOR THE SOUTHERN DISTRICT OF NEW YORK.

THE CLEVELAND TRUST COMPANY,
Plaintiff,
vs.
THE NATIONAL PISTON COMPANY, INCORPORATED,
Defendant.

IN EQUITY
No. 27-32.

ANSWER.

Defendant for its answer to the Bill of Complaint says:

I.

Defendant admits the allegation of Paragraph II of the Complaint, except that defendant denies that it has committed or is threatening to continue to commit any of the acts of infringement alleged in said complaint.

II.

Defendant denies each and every of the allegations of Paragraph IV of the Complaint, except that defendant admits that Letters Patent No. 1,092,870 were granted on the 14th day of April, 1914 to Edward O. Spillman and Louis P. Moores.

III.

Defendant denies any knowledge or information thereof sufficient to form a belief as to each and every of the allegations contained in Paragraphs V, VII, and IX of the Complaint herein.

IV.

Defendant denies each and every of the allegations of Paragraph VI of the Complaint, except that defendant admits that Letters Patent No. 1,279,184 were granted on the 7th day of September, 1918 to Packard Motor Car Company.

V.

Defendant denies each and every of the allegations of Paragraph VIII of the Complaint, except that defendant admits that Letters Patent No. 1,327,147 were granted on the 6th day of January, 1920 to Packard Motor Car Company.

VI.

Defendant denies each and every of the allegations of Paragraph X of the Complaint herein, except that defendant admits that Letters Patent No. 1,402,309 were granted on the 3rd day of January, 1922 to plaintiff, The Cleveland Trust Company.

VII.

Defendant denies each and every of the allegations of Paragraph XI of the Complaint herein, except that defendant admits notice of said Letters Patent of the United States and each of them.

VIII.

Defendant denies each and every of the allegations of Paragraph XII of the Complaint herein, except that defendant admits that plaintiff has caused notice to be given to the defendant of alleged infringement of said Letters Patent and each of them.

IX.

Upon information and belief defendant avers that said Letters Patent Nos. 1,092,870, 1,279,184, 1,327,147 and 1,402,309 are each invalid and void because the alleged invention described and claimed therein or substantial and material parts thereof had been patented and described in the following United States and foreign Letters Patent and printed publications prior to the alleged invention or discovery thereof by the alleged respective inventors named in each of said patents, and were known to and used by the patentees of said United States letters patent, whose residences are stated in their respective patents, at their said places of residences and elsewhere:

X.

On information and belief defendant avers that said Letters Patent Nos. 1,327,147 and 1,403,309 are each invalid and void because the alleged invention described and claimed therein or substantial and material parts thereof had been patented and described in the following United States and foreign letters patent and printed publications prior to the alleged invention or discovery thereof by the respective alleged inventors, and were known to and used by the patentees of said United States Letters Patent, whose residences are stated in their respective patents, at their said places of residence and elsewhere:

French,	480,644,	Aug. 31, 1916,	Societe Anonyme.

XI.

Upon information and belief defendant avers that said Letters Patent No. 1,402,309 are invalid and void because the alleged invention described and claimed therein or substantial and material parts thereof had been patented and described in the following United States and foreign letters patent and printed publications prior to the alleged invention or discovery thereof by said Louis P. Mooers, and were known to and used by the patentees of said United States letters patent, whose residences are stated in their respective patents, at their said places of residence and elsewhere:

U. S. Patent No. 1,114,229, Oct. 20, 1914, M. G. Chandler,
French " " 480,644, Jan. 10, 1916, Delaney.

XII.

Upon information and belief defendant avers that said Letters Patent Nos. 1,092,870, 1,279,184, 1,327,147 and 1,402,309 are invalid and void because the alleged inventions and improvements attempted to be patented thereby did not at the respective dates of the applications for said letters patent, or at the respective times of the said alleged invention thereof, involve or require invention; that, in view of the state of the art as it existed at that time, it did not involve the exercise of the inventive faculty to devise and produce the apparatus described and claimed respectively in said letters patent but merely the exercise of mechanical skill, and that none of the alleged inventions of said letters patent produced any new and useful result not already known to others and in common use by others skilled in the art prior to the respective dates of application for said letters patent and prior to the alleged invention thereof by the respective applications for said letters patent.

XIII.

Upon information and belief defendant avers that the alleged inventions respectively said to be described and claimed in said Letters Patent Nos. 1,092,870, 1,279,184, 1,327,147 and 1,402,309 were subsequent to the grant of said respective letters patent and each of them, had been prior thereto, notoriously and continuously and openly used by the public, including this defendant, with full knowledge of the plaintiff and in violation of its alleged rights under said Letters Patent Nos. 1,092,870, 1,279,184, 1,327,147 and 1,402,309, but without interference by it from the date of the grant of said respective letters patent to a time just prior to the filing of the complaint herein, by which conduct plaintiff and its predecessors in title to said Letters Patent Nos. 1,092,870, 1,279,184, 1,327,147 and 1,402,309, acquiesced in the use now alleged to be an infringement and abandoned the inventions to the public and led the trade and the public generally into the belief that the said alleged inventions had been abandoned to the public; and defendant alleges that plaintiff has been guilty of laches in the premises and that the complaint herein is without equity and that plaintiff is estopped from now asserting its alleged rights in said Letters Patent Nos. 1,092,870, 1,279,184, 1,327,147 and 1,402,309, and each of them, against this defendant, particularly as to any acts of infringement prior to the filing of the bill of complaint herein.

Wherefore this defendant prays that the bill of complaint be dismissed with costs.

September 15, 1923.

IN THE UNITED STATES DISTRICT COURT
SOUTHERN DISTRICT OF NEW YORK.

THE CLEVELAND TRUST COMPANY
vs.
THE NATIONAL PISTON COMPANY, INC.
} IN EQUITY No. 27-32.

FINAL DECREE.

This cause having come on to be heard at this term upon the consent of the parties to the entry of this decree and thereupon in consideration thereof, it is ordered, adjudged and decreed as follows:

FIRST: That Letters Patent to Edward O. Spillman and Louis P. Mooers, No. 1,092,870, April 14th, 1914 for Pistons for Explosion Engines or Motors is good and valid in law;

SECOND: That the said Edward O. Spillman and Louis P. Mooers are the true and original inventors of the invention and improvements described and claimed in said Letters Patent;

THIRD: That Letters Patent to Jesse G. Vincent No. 1,279,184, Sept. 17, 1918, for Pistons is good and valid in law;

FOURTH: That the said Jesse G. Vincent is the true and original inventor of the inventions and improvements described in said Letters Patent;

FIFTH: That Letters Patent to Harold D. Church, No. 1,327,147, Jan. 6th, 1920, for Hydro-Carbon Motor is good and valid in law;

SIXTH: That the said Harold D. Church is the true and original inventor of the inventions and improvements described in said Letters Patent;

SEVENTH: That Letters Patent to Louis P. Mooers, No. 1,402,309, Jan. 3rd, 1922, for Pistons for Internal Combustion Motors is good and valid in law;

EIGHTH: That the said Louis P. Mooers is the true and original inventor of the inventions and improvements described in said Letters Patent;

NINTH: That the said The Cleveland Trust Company, the Plaintiff, is the lawful owner of said patents and each of them;

TENTH: That the Defendant has infringed upon the said Letters Patent, and each of them, and upon the exclusive rights of the Plaintiff under the same by the manufacture, use and sale of Pistons.

ELEVENTH: Accounting having been waived, no accounting is ordered.

TWELFTH: That a perpetual injunction issue out of and under the seal of this court directed to the said Defendant, its associates, directors, officers, attorneys, clerks, agents, servants, workmen and others employed enjoining and restricting them and each of them, from directly or indirectly making or causing to be made, using or causing to be used or vending to others to be used in any manner, any article, device, apparatus or piston containing, embodying or employing the said inventions or improvements, or any of them covered by the said Letters Patent, or of any piston capable of or adapted to be used in infringement of said patents, or either of them, or from infringing upon or violating the said Letters Patent or either of them in any way whatsoever without the license of the owner or owners present or future of said patents.

THIRTEENTH: No costs are taxed.

FOURTEENTH: The parties having waived appeal, no petition for appeal will be entertained and no order for appeal will be allowed.

F. A. WINSLOW,
United States District Judge.

We consent to the entry of the above decree.

EDWARD R. ALEXANDER,
Counsel for Plaintiff.

GIFFORD & SCULL,
Counsel for Defendant.

DEFENDANTS' EXHIBIT 4-Z.

Bill of Complaint in Case No. 535 in the United States District Court for the Eastern District of Michigan, The Cleveland Trust Company vs. E. C. Long Piston Company and E. C. Long.

(Filed January 27, 1934.)

IN THE UNITED STATES DISTRICT COURT

IN AND FOR THE EASTERN DISTRICT OF MICHIGAN.

THE CLEVELAND TRUST COMPANY, *Plaintiff*, vs. E. C. LONG PISTON COMPANY and E. C. LONG, *Defendants.*	IN EQUITY No. 535.

BILL OF COMPLAINT.

To the Honorable Judges of the United States District Court for the Eastern District of Michigan:

The Cleveland Trust Company, a corporation organized and existing under and by virtue of the laws of the State of Ohio, and having its principal office and place of business at Cleveland in said State, brings this bill of complaint against E. C. Long Piston Company, a corporation organized and existing under and by virtue of the laws of the State of Michigan, and E. C. Long, a resident of Detroit, Michigan and a citizen of said State, both having a regular, established and joint place of business at Detroit in the State of Michigan, within the aforesaid Eastern District of Michigan, and thereupon your Orator complains and says:

I.

That your Orator, The Cleveland Trust Company, is a corporation duly organized and existing under and by virtue of the laws of the State of Ohio, and has its principal office and place of business in Cleveland in said State.

II.

That the defendant, E. C. Long Piston Company, is a corporation duly organized and existing under and by

virtue of the laws of the State of Michigan, and the defendant, E. C. Long, is a resident and citizen of the State of Michigan, and both have a regular, established and joint place of business and principal office at Detroit in the State of Michigan, within the aforesaid Eastern Judicial District of Michigan, where they, and each of them, have committed the acts of infringement hereinafter set forth.

III.

That the jurisdiction of the Court in this cause is based upon the fact that the suit is one touching patent rights, and is brought to restrain infringement of certain Letters Patent owned by the plaintiff, and for an accounting of profits and damages arising from past infringement of said Letters Patent by the defendants.

IV.

That heretofore and before the 18th day of July, 1913, Edward O. Spillman and Louis P. Mooers, citizens of the United States, residing in the County of Niagara, State of New York, were the original, first and joint inventors of certain new and useful improvements in Pistons for Explosion Engines or Motors, fully described in Letters Patent of the United States No. 1,092,870, hereinafter mentioned, which invention or improvement was not known or used by others in this country, or patented or described in any printed publication in this or any foreign country, prior to their invention thereof, or more than two years prior to their application for said Letters Patent, and had not been in public use or on sale in this country for more than two years prior to said application, and had not been abandoned to the public, and had not been patented or caused to be patented by them or their legal representatives or assigns in any foreign country upon an application filed more than twelve months prior to the filing of their application for Letters Patent of the United States therefor; that the said Edward O. Spillman and Louis P. Mooers made due application to the Commissioner of Patents of the United States in accordance with the then existing acts of Congress, for Letters Patent of the United States for said invention or improvement, and having in all respects complied with the conditions and requisitions of said acts of Congress, on the 14th day of April, 1914, Letters Patent of the

United States No. 1,092,870, signed, sealed and executed in due form of law, for the said invention or improvement were issued and delivered unto said Edward O. Spillman and Louis P. Mooers, whereby there was secured unto them, their successors and assigns for the term of seventeen years from the said 14th day of April, 1914, the sole and exclusive right to make, use and sell to others to be used, throughout the United States and the territories thereof the aforesaid invention or improvement, all as by said Letters Patent, or a duly authenticated copy thereof in Court to be produced and shown unto your Honor, will more fully and at large appear.

V.

That subsequent to the granting of the aforesaid Letters Patent, namely, on or about the 16th day of June, 1916, by an instrument in writing, one George B. Pitts acquired from said Edward O. Spillman and The Herschel Spillman Company, a corporation of the State of New York, the undivided one half of the entire right and interest in, to and under said Letters Patent of the United States No. 1,092,870, said assignment having been duly recorded on the 5th day of September, 1916 in Liber R-101, page 1 of the Transfers of Patents; that thereafter and on or about the 3rd day of July, 1919 the said George B. Pitts by an instrument in writing assigned said undivided one half of the entire right, title and interest in, to and under said Letters Patent No. 1,092,870, to your Orator, The Cleveland Trust Company, which assignment was duly recorded on the 28th day of July, 1919 in Liber Q-107, page 336 of the Transfers of Patents; and that the said Louis P. Mooers on the 10th day of July, 1919, by an instrument in writing assigned the undivided one half of the entire right, title and interest in, to and under said Letters Patent No. 1,092,870 to your Orator, The Cleveland Trust Company, which assignment was duly recorded on the 28th day of July, 1919, in Liber Q-107, page 339 of the Transfers of Patents; whereby your Orator became vested with and holds the entire right, title and interest in, to and under said Letters Patent No. 1,092,870, as will more fully and at large appear upon production in Court of the assignments aforesaid.

VI.

That heretofore and before the 22nd day of October, 1913, Jesse G. Vincent, a citizen of the United States, and resident of Detroit, Wayne County, State of Michigan, was the original, first and true inventor of certain new and useful improvements in Pistons, fully described in Letters Patent of the United States No. 1,279,184, hereinafter mentioned, which invention or improvement was not known or used by others in this country, or patented or described in any printed publication in this or any foreign country, prior to his invention thereof, or more than two years prior to his application for said Letters Patent; had not been in public use or on sale in this country for more than two years prior to said application; had not been abandoned to the public, and had not been patented or caused to be patented by him or his legal representatives or assigns in any foreign country upon an application filed more than twelve months prior to the filing of his application for Letters Patent of the United States therefor; that the said Jesse G. Vincent made due application to the Commissioner of Patents of the United States in accordance with the then existing acts of Congress, for Letters Patent of the United States for said invention and improvement, and by an instrument in writing duly executed and delivered by him, and duly recorded in the Patent Office of the United States, assigned and transferred the entire right, title and interest in and to said invention and improvement and in and to said application for Letters Patent, to Packard Motor Car Company, a corporation organized and existing under the laws of the State of Michigan, and authorized and requested the Commissioner of Patents to issue the Letters Patent upon said application and for the said invention and improvement to the said Packard Motor Car Company, and having in all respects complied with the conditions and requisitions of said acts of Congress, on the 17th day of September, 1918, Letters Patent of the United States No. 1,279,184, signed, sealed and executed in due form of law for the said invention and improvement were issued and delivered unto said Packard Motor Car Company, as assignee of the said Jesse G. Vincent, whereby there was secured unto said Packard Motor Car Company, and its successors and assigns for the term of seventeen years from the said 17th day of September, 1918, the sole and exclusive right to make, use and vend to others to be used, throughout the United States and

the territories thereof, the aforesaid invention and improvement; all as by said Letters Patent, or a duly authenticated copy thereof in Court to be produced and shown unto your Honors, will more fully and at large appear.

VII.

That subsequent to the granting of the aforesaid Letters Patent, namely on or about the 11th day of September, 1922, by an instrument in writing said Packard Motor Car Company assigned the entire right, title and interest in, to and under said Letters Patent of the United States No. 1,279,184 to your Orator, The Cleveland Trust Company, which assignment was duly recorded on the 18th day of September, 1922, in Liber W-117 page 44 of the Transfers of Patents; whereby your Orator became vested with and holds the entire right, title and interest in, to and under said Letters Patent No. 1,279,184, as will more fully and at large appear upon production in Court of the assignment aforesaid.

VIII.

That heretofore and before the 11th day of May, 1916, Harold D. Church, a citizen of the United States and a resident of Detroit, Wayne County, State of Michigan, was the original, first and true inventor of certain new and useful improvements in Hydro-Carbon Motor, fully described in Letters Patent of the United States No. 1,337,147, hereinafter mentioned, which invention or improvement was not known or used by others in this country, or patented or described in any printed publication in this or any foreign country, prior to his invention thereof, or more than two years prior to, his application for said Letters Patent, and had not been in public use or on sale in this country for more than two years prior to said application; had not been abandoned to the public; and had not been patented or caused to be patented by him or his legal representatives or assigns in any foreign country upon an application filed more than twelve months prior to the filing of his application for Letters Patent in the United States therefor; that the said Harold D. Church made due application to the Commissioner of Patents of the United States in accordance with the then existing Acts of Congress, for Letters Patent of the United States for said invention and improvement, and by an instrument in writing duly

executed and delivered by him, and duly recorded in the Patent Office of the United States, assigned and transferred the entire right, title and interest in and to said invention and improvement and in and to said application for Letters Patent to Packard Motor Car Company, a corporation organized and existing under the laws of the State of Michigan, and authorized and requested the Commissioner of Patents to issue the Letters Patent upon said application and for said invention and improvement to the said Packard Motor Car Company, and having in all respects complied with the conditions and requisitions of said Acts of Congress, on the 6th day of January, 1920 Letters Patent of the United States No. 1,327,147, signed, sealed and executed in due form of law for the said invention and improvement were issued and delivered unto said Packard Motor Car Company, as assignee of said Harold D. Church, whereby there was secured unto said Packard Motor Car Company and its successors and assigns for the term of seventeen years from the 6th day of January, 1920, the sole and exclusive right to make, use and vend to others to use throughout the United States and the territories thereof, the aforesaid invention and improvement; all as by said Letters Patent, or a duly authenticated copy thereof in Court to be produced and shown unto your Honors will more fully and at large appear.

IX.

That subsequent to the granting of the aforesaid Letters Patent, namely on or about the 11th day of September, 1922, by an instrument in writing, said Packard Motor Car Company assigned the entire right, title and interest in, to and under said Letters Patent of the United States No. 1,327,147 to your Orator, The Cleveland Trust Company, which assignment was duly recorded on the 18th day of September, 1922, in Liber C-117 page 64 of the Transfers of Patents; whereby your Orator became vested with and holds the entire right, title and interest in, to and under said Letters Patent No. 1,327,147, as will more fully and at large appear upon production in Court of the assignment aforesaid.

X.

That heretofore and before the 2nd day of June, 1917, Louis P. Mooers, a citizen of the United States, residing at Cincinnati, Hamilton County, State of Ohio,

was the original, first and true inventor of certain new and useful improvements in Pistons for Internal Combustion Motors, fully described in Letters Patent of the United States No. 1,402,309, hereinafter mentioned, which invention or improvement was not known or used by others in this country, or patented or described in any printed publication in this or any foreign country, prior to his invention thereof, or more than two years prior to his application for said Letters Patent; had not been in public use or on sale in this country for more than two years prior to said application; had not been abandoned to the public, and had not been patented or caused to be patented by him or his legal representatives or assigns in any foreign country upon an application filed more than twelve months prior to the filing of his application for Letters Patent of the United States therefor; that the said Louis P. Mooers made due application to the Commissioner of Patents of the United States in accordance with the then existing acts of Congress, for Letters Patent of the United States for said invention and improvement and by an instrument in writing duly executed and delivered by him and duly recorded in the Patent Office of the United States in Liber P-103, page 133 of the Transfers of Patent, assigned an undivided half of the entire right, title and interest in, and to said invention and improvement and in and to said application for Letters Patent to George B. Pitts of Cleveland, Ohio, and authorized and requested the Commissioner of Patents to issue the Letters Patent upon said application and for said invention and improvement to said George B. Pitts and Louis P. Mooers; and by said instruments in writing specified in Article V of this bill as recorded in Liber Q-107, pages 338 and 339 of the Transfer of Patents, said George B. Pitts and Louis P. Mooers, respectively, each assigned an undivided one-half of the entire right, title and interest in, to and under said Letters Patent of the United States No. 1,402,309 to your Orator, The Cleveland Trust Company, and authorized and requested the Commissioner of Patents to issue the Letters Patent upon said application and for said invention and improvement to said The Cleveland Trust Company, whereby your Orator became vested with and holds the entire right, title and interest in, to and under said Letters Patent No. 1,402,309, as will more fully and at large appear upon production in Court of the said Letters Patent and the assignments aforesaid.

XI.

And your Orator further avers and shows unto your Honors that the said defendants, E. C. Long Piston Company and E. C. Long, as your Orator is informed and believes, having due and timely notice of said Letters Patent of the United States, and each of them, and well knowing the premises and the exclusive rights and privileges as aforesaid secured to your Orator by the said Letters Patent, but contriving and planning to injure your Orator and deprive it of the profits, benefits, and advantages which would have otherwise accrued to your Orator from the said Letters Patent have been since the grant of each of the Letters Patent aforesaid, and still are in the said Eastern District of Michigan, unlawfully, wrongfully, and without license or permission of your Orator, manufacturing, or causing to be manufactured, using and selling Pistons constructed according to and containing the aforesaid inventions, discoveries or improvements patented by said Letters Patent in violation and infringement of the aforesaid exclusive rights and privileges of your Orator, and have threatened to continue such infringing acts by making, using and selling Pistons in violation and infringement of your Orator's exclusive rights and privileges under said Letters Patent and to your Orator's great and irreparable loss and damage and contrary to equity and good conscience and to the manifest injury of your Orator in the premises.

XII.

That your Orator has caused notice to be given to the defendants, and each of them, of this aforesaid infringement of said Letters Patent, and each of them, and of the rights of your Orator in the premises, and requested the defendants, and each of them, to desist from such infringement; but that they and each of them have disregarded said notice and request and are continuing such infringement of said Letters Patent as aforesaid;

And forasmuch as your Orator can have no adequate relief except in this Court, and to the end therefor that the defendants may, if they can, show cause why your Orator should not have the relief hereinafter prayed, and may make full disclosure of all the matters aforesaid, your Orator prays

1. That the said defendants, E. C. Long Piston Company and E. C. Long, may be required to appear and make full, true, direct and perfect answer to the matters

heretofore stated and charged, but not under oath, answer under oath being hereby expressly waived.

2. That the said defendants, E. C. Long Piston Company and E. C. Long, may be compelled to account for and pay over to your Orator the gains and profits which they, and each of them, have made and received, or shall have made and received, from said violation of your Orator's rights and from said infringement of the aforesaid Letters Patent, and each of them, and that your Honors may assess or cause to be assessed under your direction, in addition to the gains and profits to be accounted for by the defendants, the damages your Orator has sustained by reason of said infringement, and that your Honors may increase the actual damages to a sum equal to three times the amount of said assessment under the circumstances of the willful and unjust infringement of your Orator's Letters Patent by the said defendants as aforesaid.

3. That your Honors may grant unto your Orator a preliminary and also a perpetual writ of injunction, issuing out of and under the seal of this Honorable Court, and directed to the said E. C. Long Piston Company and E. C. Long, and enjoining it and him, and its and his officers, agents, servants, attorneys and workmen, and each of them, from making, using or vending or causing to be made, used or vended, or in any wise counterfeiting or imitating the inventions and improvements described and claimed in the aforesaid Letters Patent, or any part thereof, and from making, using or vending to others to be used, or causing to be made, used or vended to others to be used, any Pistons, or any parts thereof, made in accordance with said Letters Patent, or any part thereof, or like or similar to Pistons and parts thereof which the defendant has heretofore made and vended to others in violation of the rights of your Orator as aforesaid, and from and in any manner infringing said Letters Patent, or any of them, and that the Pistons and parts thereof embodying said patented inventions and improvements, or any part thereof, now in possession of the defendants, or either of them or their agents or representatives, may be destroyed or delivered up to your Orator for that purpose.

4. That the said defendants, E. C. Long Piston Company and E. C. Long, may be decreed to pay the costs of this suit, and that your Orator may have such other and further relief as the equity of the case may require and to your Honors may seem meet.

And may it please your Honors to grant unto your Orator a writ of injunction conformable to the prayer of this bill, and also a writ of subpoena of the United States of America, directed to the said E. C. Long Piston Company and E. C. Long, commanding it and him, respectively, to appear and make answer unto this bill of complaint and to abide and conform to such order and decree in the premises as to the Court shall seem meet and be required by the principles of equity and good conscience.

And your Orator will ever pray.

S. District Court N. D. O.

Runs With Less Clearance Than Cast Iron Pistons—

—and so does

MANY of America's automobile manufacturers have adopted E. C. L. corresponding clearances when they specify aluminum pistons because they run with less clearance than cast iron pistons and consequently reduce the amount of "slap" and noise when the motor is cold.

E. C. L. Non-X Pistons quickly reduce the clearance of gas and oil and increase the power and speed of the motor. They run cooler, reduce vibration and wear on bearings and insure quick hookups.

E. C. L. Non-X Pistons are practically thrown from light-weight Aluminum Alloy. They may be fitted quickly and easily to any motor with very little alteration. The piston is furnished with three suitable grooves for the proper location of the lower part of the piston. The piston heads are machined to a smaller size than the skirt of the piston so that none of the excessive expansion of the head, which does not interfere with the running fit of the piston. This insures a perfect fit at all times.

Install a set of E. C. L. Non-X Pistons in your next overhaul job and note how smoothly the motor runs—how quiet and responsive. Note the reduction in vibration and the elimination of the so-called "piston slap." Start the motor cold and see how splendidly it runs and how quickly it responds. There are all factors which will appeal to every motorist—especially those who are driving last year's cars or the year before. Add you can capitalize the factor in your selling talk.

E. C. L. Non-X Pistons are carried in stock for standard cold conditions for practically all makes of motors.

We will gladly tell you more about the profitable opportunities with E. C. L. Non-X Pistons. Write us at once for complete information.

Bill of Complaint in Case No. 3510 in the U. S. District Court for the Northern District of Ohio, The Cleveland Trust Company and Chrysler Corporation vs. The Simmons Mfg. Co. and Sterling Products Corp.

(Filed in District Court.)

IN THE UNITED STATES DISTRICT COURT

NORTHERN DISTRICT OF OHIO
EASTERN DIVISION

THE CLEVELAND TRUST COMPANY,
CHRYSLER CORPORATION,
Plaintiffs,
vs.
THE SIMMONS MANUFACTURING COMPANY,
STERLING PRODUCTS CORPORATION,
Defendants.

(In Equity No. 3510.)

Spillman-Mooers	1,092,870
Mooers	1,402,309
Franquist	1,153,902
Schmiedeknecht	1,256,265
Howdeshell	16,273
Maynard	1,655,968
Jardine	1,763,523
Gulick	1,815,773

AMENDED BILL OF COMPLAINT

Now come the Plaintiffs and, pursuant to the Order of this Court hereto annexed, file this amended Bill of Complaint. Plaintiffs allege:

1. That Plaintiff, The Cleveland Trust Company, is a corporation organized and existing under the laws of the State of Ohio, having its principal place of business at Cleveland, State of Ohio.

That Plaintiff, Chrysler Corporation, is a corporation organized and existing under the laws of the State of Delaware, having its principal place of business at Highland Park, State of Michigan.

2.

That Defendant, The Simmons Manufacturing Company of Cleveland, Ohio, is a corporation organized and existing under the laws of the State of Ohio and is a citizen and inhabitant thereof, having a regular and established place of business at 3506 Perkins Avenue in the City of Cleveland, County of Cuyahoga and State of Ohio.

That Defendant, Sterling Products Corporation of St. Louis, Missouri, is a corporation duly organized and existing under the laws of the State of Missouri and has a regular and established place of business at 2914 North Market Street in the City of St. Louis, County of St. Louis, and State of Missouri.

3.

This suit is brought under the patent laws of the United States, and seeks injunctive and other relief against the defendants and each of them for infringements and contributory infringements committed by each and both defendants within this Judicial District and elsewhere within the United States.

4.

That heretofore and prior to the 18th day of July, 1913, Edward O. Spillman and Louis P. Mooers, citizens of the United States, then residing at North Tonawanda in the County of Niagara and State of New York, were the original, first and joint inventors of certain new and useful improvements in Pistons for Explosion Engines or Motors, fully described in Letters Patent of the United States, No. 1,092,870 hereinafter mentioned, which invention or improvement was not known or used by others in this country, or patented or described in any printed publication in this or any foreign country, prior to their invention thereof, or more than two years prior to their application for said Letters Patent, and has not been in public use or on sale in this country for more than two years prior to said application, and had not been abandoned to the public, and had not been patented or caused to be patented by them or their legal representatives or assigns in any foreign country upon an application filed more than twelve months prior to the filing of their application for Letters Patent of the United States therefor; that the said Edward O. Spillman and Louis P. Mooers made due application to the Commissioner of Patents of the United States in accordance with the then existing Acts of Congress, for Letters Patent of the United States for said invention or improvement, and having in all respects complied with the conditions and requirements of said Acts of Congress, on the 14th day of April, 1914, Letters Patent of the United States No. 1,092,870, signed, sealed and executed in due form of law, for the said invention or improvement were is-

sued and delivered unto said Edward O. Spillman and Louis P. Mooers, whereby there was secured unto them, their successors and assigns for the term of seventeen years from the said 14th day of April, 1914, the sole and exclusive right to make, use and sell to others to be used, through the United States and the territories thereof, the aforesaid invention or improvement, all as by said Letters Patent, or a duly authenticated copy thereof in Court to be produced and shown unto Your Honors, will more fully and at large appear.

5.

That subsequent to the granting of the aforesaid Letters Patent, namely, on or about the 16th day of June, 1916, by an instrument in writing, one George B. Pitts acquired from said Edward O. Spillman and The Herschel Spillman Company, a corporation of the State of New York, the undivided one-half of the entire right and interest in, to and under said Letters Patent of the United States No. 1,092,870, said assignment having been duly recorded on the 5th day of September, 1916, in Liber R-101, page 1 of the Transfers of Patents; that thereafter and on or about the 3rd day of July, 1919, the said George B. Pitts by an instrument in writing that was duly recorded in the United States Patent Office on the 28th day of July, 1919 in Liber Q-107, page 336 of the Transfers of Patents, assigned said undivided one-half of the entire right, title and interest in, to and under said Letters Patent No. 1,092,870 to your Orator, The Cleveland Trust Company; and that the said Louis P. Mooers on the 10th day of July, 1919, by an instrument in writing that was duly recorded in the United States Patent Office on the 28th day of July, 1919, in Liber Q-107, page 339 of the Transfers of Patents, assigned the remaining undivided one-half of the entire right, title and interest in, to and under said Letters Patent No. 1,092,870 to your Orator, The Cleveland Trust Company, whereby your Orator became vested with and holds the entire right, title and interest in, to and under said Letters Patent No. 1,092,870, as will more fully and at large appear upon production in Court of the assignments aforesaid.

6.

That heretofore and prior to the 2nd day of June, 1917, Louis P. Mooers, a citizen of the United States, then residing at Cincinnati, Hamilton County, State of Ohio, was the original, first and true inventor of certain new and useful improvements in Pistons for Internal Combustion Motors, fully described in Letters Patent of the United States No. 1,402,309, hereinafter mentioned, which invention or improvement was not known or used by others in this country or patented or described in any printed publication in this or any foreign country, prior to his invention thereof, or more than two years prior to his application for said Letters Patent, had not been in public use or on sale in this country for more than two years prior to said application; had not been abandoned to the public, and had not been patented or caused to be patented by him or his legal representatives or assigns in any foreign country upon an application filed more than twelve months prior to the filing of his application for Letters Patent of the United States therefor; that the said Louis P. Mooers made due application to the Commissioner of Patents of the United States in accordance with the then existing Acts of Congress, for Letters Patent of the United States for said invention and improvement.

7.

That by an instrument in writing duly executed and delivered by said Louis P. Mooers and duly recorded in the United States Patent Office in Liber P. 103, page 133 of the Transfers of Patents, said Louis P. Mooers assigned an undivided half of the entire right, title and interest in, and to said invention and improvement and in and to said application for Letters Patent to George B. Pitts of Cleveland, Ohio and authorized and requested the Commissioner of Patents to issue the Letters Patent upon said application and for said invention and improvement to said George B. Pitts and Louis P. Mooers; and by said instruments in writing specified in Article 3 of this Bill as recorded in Liber Q-107, pages 336 and 339 of the Transfers of Patents, said George B. Pitts and Louis P. Mooers respectively each assigned his undivided one-half of the entire right, title and interest in, to and under said Letters Patent of the United States No. 1,402,309 to your Orator, The Cleveland Trust Company, and authorized and requested the Commissioner

of Patents to issue the Letters Patent upon said application and for said invention and improvement to said The Cleveland Trust Company; whereby your Orator became vested with and holds the entire right, title and interest in, to and under said Letters Patent No. 1,402,309, as will more fully and at large appear upon production in Court of the said Letters Patent and the assignments aforesaid.

8.

That heretofore and prior to the 1st day of August, 1914, Gustave E. Franquist deceased, then a citizen of the United States residing in the City of New Brunswick, County of Middlesex and State of New Jersey, was the original, first and sole inventor of certain new and useful improvements in Pistons, fully described in Letters Patent of the United States No. 1,153,902, which invention or improvement was not known or used by others in this country, or patented or described in any printed publication in this or any foreign country prior to his invention thereof for more than two years prior to his application for Letters Patent, and had not been in public use or on sale in this country for more than two years prior to said application, and had not been abandoned to the public, and had not been patented or caused to be patented by him or his legal representatives or assigns in any foreign country upon an application filed more than twelve months prior to the filing of his application for Letters Patent of the United States therefor; that said Gustave E. Franquist made such application to the Commissioner of Patents of the United States in accordance with the then existing Acts of Congress for Letters Patent of the United States for said invention or improvement and, having in all respects complied with the conditions and requirements of said Acts of Congress, on or about the 21st day of September, 1915, Letters Patent of the United States No. 1,153,902, signed, sealed and executed in due form of law for the said invention or improvement, were issued and delivered unto said Gustave E. Franquist, whereby there was secured to him, his successors and assigns, for the term of seventeen years from the said 21st day of September, 1915, the sole and exclusive right to make, use and sell to others to be used throughout the United States and the territories thereof, pistons embodying the aforesaid invention or improvements, all by said Letters Patent or

a duly authenticated copy thereof in Court to be produced and shown unto Your Honors, as will more fully and at large appear.

9.

That subsequent to the granting of the aforesaid Letters Patent, namely on or about the 16th day of May, 1924, by an instrument in writing that was duly recorded in the United States Patent Office on or about the 9th day of June, 1924, in Liber 121 of the Transfers of Patents, page 199, said Gustave E. Franquist assigned the entire right, title and interest in, to and under said Letters Patent of the United States No. 1,153,902 to your Orator, The Cleveland Trust Company; whereby your Orator became vested with and now owns and holds the entire right, title and interest in, to and under said Letters Patent of the United States No. 1,153,902, as will more fully and at large appear upon production in Court of the assignments aforesaid.

10.

That heretofore and prior to the 22nd day of May, 1920, Roland M. Howdeshell, a citizen of the United States then residing in the City of St. Louis, County of St. Louis and State of Missouri, was the original, first and sole inventor of certain new and useful improvements in Pistons for Engine Cylinders, as fully described in Letters Patent of the United States No. 1,473,233, which invention or improvement was not known or used by others in this country, or patented or described in any printed publication in this or any foreign country prior to his invention thereof, or more than two years prior to his application for Letters Patent; had not been in public use or on sale in this country for more than two years prior to said application; had not been abandoned to the public, and had not been patented or caused to be patented by him or his legal representatives or assigns in any foreign country upon an application filed more than twelve months prior to the filing of his application for Letters Patent of the United States therefor; that said Roland M. Howdeshell made due application to the Commissioner of Patents of the United States in accordance with the then existing Acts of Congress for Letters Patent of the United States for said invention or improvement.

11.

That by an instrument in writing duly signed, sealed and delivered on or about the 20th day of May, 1920, and duly recorded in the United States Patent Office on or about the 22nd day of May, 1920, in Liber H-110, page 170 of the Transfers of Patents, the said Roland M. Howdeshell did sell, assign and transfer to H. & H. Machine Company, a corporation of Missouri having its principal place of business at St. Louis, Missouri, the entire right, title and interest in and to the said invention and application for Letters Patent and Letters Patent to issue thereon, and said Roland M. Howdeshell, having in all respects duly complied with the conditions and requirements of said Acts of Congress, and after due examination of the aforesaid application, the Commissioner of Patents did, on or about the 6th day of November, 1923, grant and deliver said Letters Patent of the United States No. 1,473,233 to said H. & H. Machine Company, in the name of the United States of America; whereby there was granted to said H. & H. Machine Company, its successors and assigns, the exclusive right to make use of said invention throughout the United States and the territories thereof, for the term of seventeen years from the said 6th day of November, 1923, as will more fully and at large appear by the production in this Court of a duly authenticated copy of said Letters Patent.

12.

That subsequent to the granting of the aforesaid Letters Patent No. 1,473,233, said H. & H. Machine Company, by an instrument in writing dated the 16th day of March, 1925 and duly recorded in the United States Patent Office on or about the 13th day of April, 1925 in Liber W-123, pages 440 and 442 of the Transfers of Patents, said H. & H. Machine Company assigned the entire right, title and interest in, to and under said Letters Patent of the United States No. 1,473,233 to The Cleveland Trust Company, plaintiff, whereby plaintiff became vested with and now holds the entire right, title and interest in, to and under said Letters Patent No. 1,473,233, as will more fully and at large appear upon production in Court of the assignments aforesaid.

13.

That on or about the 20th day of August, 1925, said Roland M. Howdeshell and said The Cleveland Trust

Company, verily believing that the aforesaid Letters Patent of the United States No. 1,473,233 were inoperative for the reason that the specification thereof was defective, and that such defect consisted particularly in the failure of the patent to claim broadly the novel features of the invention therein disclosed, said Letters Patent were surrendered to the United States Patent Office and an application for re-issue of the aforesaid Letters Patent was made by said Roland M. Howdeshell and his assignee, The Cleveland Trust Company, plaintiff.

14.

That after due examination of said application for re-issue of said Letters Patent, the Commissioner of Patents did, on or about the 23rd day of February, 1926, grant and deliver to plaintiff, The Cleveland Trust Company, as assignee of said H. & H. Machine Company, in the name of the United States of America, United States re-issue Letters Patent No. Re-16,273; whereby there was granted to plaintiff, its successors and assigns, the exclusive right, for the term of seventeen years from said 23rd day of February, 1926, to make, use and sell pistons embodying said inventions throughout the United States and the territories thereof, as will more fully and at large appear by production here in this Court of the original of said Re-issue Letters Patent Re-16,273.

15.

That heretofore, and prior to the third day of January, 1921, Howard E. Maynard, then residing at Detroit, in the County of Wayne and State of Michigan, was the original, first and true inventor of certain new and useful improvements in Pistons fully described in Letters Patent of the United States No. 1,655,968 hereinafter mentioned, which invention or improvement was not known or used by others in this country, or patented or described in any printed publication in this or any foreign country before his said invention or discovery thereof, or more than two years prior to his application for Letters Patent therefor, and had not been in public use or on sale in this country for more than two years prior to his application for Letters Patent therefor; and had not been patented or caused to be patented by him or his legal representatives or assigns in any foreign country upon an application filed more than twelve months prior to the filing of the application for Letters Patent thereon in this country.

16.

That the said Howard E. Maynard, being as aforesaid, the inventor of the said improvement, made application to the Commissioner of Patents of the United States for Letters Patent in accordance with the then existing Acts of Congress, and, having in all respects complied with the conditions and requirements of said Acts of Congress, on the tenth day of January, 1928 Letters Patent of the United States numbered 1,655,968, signed, sealed and executed in due form of law, for the said invention or improvement, were issued to said Chrysler Corporation, a corporation of Delaware, at Highland Park, Michigan, plaintiff, and Aluminum Company of America, a corporation of Pennsylvania, at Pittsburgh, Pa., as assignees each of one-half of the entire right, title and interest in and to said Letters Patent, whereby there was secured to Chrysler Corporation and Aluminum Company of America for the term of seventeen years from the tenth day of January, 1928, the sole and exclusive right to make, use and sell to others to be used throughout the United States and the territories thereof, the aforesaid invention or improvement, all as by said Letters Patent, or a duly authenticated copy thereof here in Court to be produced and shown unto Your Honors, as will more fully and at large appear.

17.

That prior to the filing of this Bill of Complaint, said Aluminum Company of America, by an instrument in writing dated February 23, 1928 and recorded in the Transfers of Patents in the United States Patent Office as of May 12, 1930 in Liber Z-143, page 283, assigned its undivided one-half interest in the entire right, title and interest in and to said Letters Patent No. 1,655,968 to The Cleveland Trust Company, plaintiff herein, together with the right to sue for and recover damages for past infringements of said Letters Patent, whereby your plaintiff, The Cleveland Trust Company, became vested with and now holds an undivided one-half interest in the entire right, title and interest in, to, and under said Letters Patent No. 1,655,968, as will more fully and at large appear upon production in Court of the assignments aforesaid.

18.

That the plaintiff, Chrysler Corporation, is a non-resident and resides without the jurisdiction of this Court and therefore cannot be served with process and made a co-defendant in this cause, and that plaintiff, The Cleveland Trust Company, has advised Chrysler Corporation of the imminent pendency of this case and of the obligation of Chrysler Corporation to join voluntarily in the bringing of this suit, but that Chrysler Corporation has refused or declined to so voluntarily join and that the plaintiff, The Cleveland Trust Company, is without remedy on the Maynard patent unless Chrysler Corporation is joined as a co-plaintiff in this cause, and therefore to prevent a failure of justice and to enable The Cleveland Trust Company to protect its interests herein, the Chrysler Corporation is made a plaintiff herein without its consent.

19.

That heretofore and prior to the 11th day of March, 1920, Frank Jardine, a citizen of the United States, then residing at Cleveland, in the County of Cuyahoga and State of Ohio, was the original, first and true inventor of certain new and useful improvements in Pistons, fully described in Letters Patent of the United States No. 1,763,523, hereinafter mentioned, which invention or improvement was not known or used by others in this country or patented or described in any printed publication in this or any foreign country, prior to his invention thereof, or more than two years prior to his application for said Letters Patent; had not been in public use or on sale in this country for more than two years prior to said application; had not been abandoned to the public, and had not been patented or caused to be patented by him or his legal representatives or assigns in any foreign country upon an application filed more than twelve months prior to the filing of his application for Letters Patent of the United States therefor; that the said Frank Jardine made due application to the Commissioner of Patents of the United States in accordance with the then existing Acts of Congress, for Letters Patent of the United States for said invention and improvement, and having in all respects complied with the conditions and requirements of said Acts of Congress, and having, by mesne assignments, as will more fully and at large appear upon production in Court of said assign-

ments, assigned his entire right, title and interest in and to said Letters Patent No. 1,763,523 to The Cleveland Trust Company, as a Trustee, and having authorized and requested the Commissioner of Patents to issue the Letters Patents upon said application and for said invention and improvements to said The Cleveland Trust Company, on or about the 10th day of June, 1930, Letters Patent of the United States No. 1,763,523, signed, sealed and executed in due form of law, for the said invention or improvement, were issued and delivered to plaintiff, The Cleveland Trust Company, whereby there was secured to it, its successors and assigns, for the term of seventeen years from the said 10th day of June, 1930, the sole and exclusive right to make, use, and sell to others to be used, throughout the United States and the territories thereof, the aforesaid invention or improvement, all as by said Letters Patent or a duly authenticated copy thereof in Court to be produced and shown unto Your Honors, will more fully and at large appear.

20.

That heretofore and prior to the 14th day of July, 1917, Victor E. Schmiedeknecht, a citizen of the United States then residing at Louisville in the County of Jefferson and State of Kentucky, was the first and true inventor of certain new and useful improvements in Pistons, fully described in Letters Patent of the United States No. 1,256,265, hereinafter mentioned, which invention and improvement was not known or used by others in this country, or patented or described in any printed publication in this or any foreign country, prior to his invention thereof, or more than two years prior to his application for said Letters Patent; had not been in public use or on sale in this country for more than two years prior to said application; had not been abandoned to the public, and had not been patented or caused to be patented by him or his legal representatives or assigns in any foreign country upon an application filed more than twelve months prior to the filing of his application for Letters Patent of the United States therefor; that the said Victor E. Schmiedeknecht made due application to the Commissioner of Patents of the United States in accordance with the then existing Acts of Congress, for Letters Patent of the United States for said invention and improvement, and having in all respects com-

plied with the conditions and requirements of said Acts of Congress, on the 12th day of February, 1918, Letters Patent of the United States No. 1,256,265, signed, sealed and executed in due form of law for the said invention or improvement, were issued and delivered unto said Victor E. Schmiedeknecht, his successors and assigns, for the term of seventeen years from said 12th day of February, 1918, the sole and exclusive right to make, use and sell to others to be used, throughout the United States and the territories thereof, the aforesaid invention or improvement, all as by said Letters Patent or a duly authenticated copy thereof in Court to be produced and shown to Your Honors will more fully and at large appear.

21.

That subsequent to the granting of the aforesaid Letters Patent No. 1,256,265, by an instrument in writing that was duly recorded in the United States Patent Office on or about the 16th day of August, 1927 in Liber F-131, page 79 of the Transfers of Patents, said Victor E. Schmiedeknecht assigned the entire right, title and interest in, to and under said Letters Patent of the United States No. 1,256,265, together with the right to sue for, collect, and retain damages and profits for past infringement under said Letters Patent to one Frank Kent of New York City; and, whereas this assignment was further amplified by further warranty and guarantee that was also recorded in the United States Patent Office on or about the 16th day of August, 1927 in Liber P-131, page 81 of the Transfers of Patents; whereby said Frank Kent, his successors and assigns, became vested with the entire right, title and interest in, to and under said Letters Patent of the United States No. 1,256,265, together with the right to sue for, collect, and retain damages and profits for past infringements of said Letters Patent.

22.

That by an instrument in writing dated October 12, 1927 and duly recorded in the United States Patent Office in the Transfers of Patents, said Frank Kent assigned the entire right, title and interest in, to and under said Letters Patent of the United States, together with the right to sue, collect, and retain damages and profits for past infringement, to Bohn Aluminum & Brass Corporation of Detroit, Michigan, its successors and assigns.

23.

That said Bohn Aluminum & Brass Corporation, by an instrument in writing dated on or about August 31st, 1927, and recorded in the United States Patent Office in Liber C-133, page 618 of the Transfers of Patents, assigned to Your Orator, The Cleveland Trust Company, its successors and assigns, the entire right, title and interest in, to and under said Letters Patent, together with the right to sue for, collect and retain damages and profits for past infringements of said Letters Patent; whereby plaintiff, The Cleveland Trust Company became vested with and now holds the entire right, title and interest in, to and under the aforesaid Letters Patent No. 1,256,265, and the right to sue for, collect and retain damages and profits for past infringement of said Letters Patent, as will more fully and at large appear upon production in this Court of the assignments aforesaid or duly authenticated copies thereof.

24.

That heretofore and prior to the 30th day of November, 1917, Edward J. Gulick, a citizen of the United States then residing in Mishawaka, County of St. Joseph, and State of Indiana was the original, first and true inventor of certain new and useful improvements in Pistons, fully described in application for Letters Patent of the United States, Serial No. 204,661, which invention was not known or used by others in this country or patented or described in any printed publication in this or any foreign country, prior to his invention thereof, or more than two years prior to his said application for Letters Patent therefor; that said invention had not been in public use or on sale in this country for more than two years prior to said application for Letters Patent, had not been abandoned to the public and had not been patented or caused to be patented by him or his legal representatives or assigns in any foreign country upon an application filed more than twelve months prior to the filing of said application for Letters Patent of the United States; that on or about November 30, 1917, said Edward J. Gulick made due application to the Commissioner of Patents of the United States in accordance with the then existing Acts of Congress, for Letters Patent of the United States for said invention or improvements and, having in all respects complied with the conditions and requirements of said Acts of Congress, on the 21st

day of July, 1931, Letters Patent of the United States No. 1,815,773 were signed, sealed and executed in due form of law for the said invention, and were issued and delivered unto Plaintiff, The Cleveland Trust Company, its successors and assigns, as assignee of the entire right, title and interest of said Edward J. Gulick, for the term of seventeen years from said 21st day of July, 1931, thereby granting to it the sole and exclusive right to make, use and sell to others to be used, throughout the United States, its territories and dependencies, the aforesaid invention or improvements, all as by said Letters Patent or a duly authenticated copy thereof in Court to be produced and shown to Your Honor, as will more fully and at large appear.

25.

That prior to the grant of aforesaid Letters Patent No. 1,815,773, said Edward J. Gulick assigned to the Packard Motor Car Company of Detroit, Michigan, his entire right, title and interest in and to the invention set forth and described in the aforesaid application for Letters Patent Serial No. 204,661 by an instrument in writing dated Nov. 23, 1917 that was duly recorded in the United States Patent Office on or about the 30th day of November, 1917, in Liber J-103, page 468 of the Transfers of Patents; whereby said Packard Motor Car Company of Detroit, Michigan, its successors and assigns became vested with the entire right, title and interest in and to the aforesaid invention and in and to said application for Letters Patent Serial No. 204,661 and in and to any Letters Patent issuing pursuant thereto.

26.

That, on or about September 11, 1922 and prior to the grant of aforesaid Letters Patent No. 1,815,773, the Packard Motor Car Company of Detroit, Michigan, assigned to The Cleveland Trust Company of Cleveland, Ohio, its entire right, title and interest in and to the invention set forth and described in the aforesaid application for Letters Patent Serial No. 204,661 and in and to said application for Letters Patent by an instrument in writing dated September 11, 1922 that was duly recorded in the United States Patent Office on or about the 13th day of September, 1922, in Liber S-116, page 485 of the Transfers of Patents, whereby said The Cleveland Trust Company of Cleveland, Ohio, its successors

and assigns became vested with, has continuously held and now owns the entire right, title and interest in and to said invention and in and to said application for Letters Patent Serial No. 204,661 and in and to said Letters Patent of the United States No. 1,815,773 that issued pursuant thereto.

27.

That the validity of each of the aforesaid Letters Patent has been recognized and acquiesced in by the public generally since the date of issue of each of said patents, except for those defendants and others encouraged by them. At various times said patents have been especially recognized and acquiesced in by parties who have discontinued infringement thereof and who have made due amends to plaintiff. Others have taken licenses under said patents. Substantial and material royalties have been paid to the plaintiff under said patents. The licensees under said patents have manufactured and sold the pistons covered by said patents in great numbers. These pistons have gone into extensive and successful use. Licensees under said patents have built plants and established organizations for the manufacture and sale of such pistons on the strength of and by reason of their confidence in the patents here in suit.

28.

That plaintiff has duly notified each and both of these defendants of their infringement of each of the aforesaid Letters Patent and has requested them and each of them to desist, but defendants and each of them have continued their infringements in defiance of said notices.

29.

These defendants, The Simmons Manufacturing Company and Sterling Products Corporation, jointly and severally, subsequent to the grant of said Letters Patent and prior to the filing of this Bill of Complaint and within six years hereof, with full knowledge of each of said Letters Patent and without the consent of plaintiff, The Cleveland Trust Company, but in violation of its rights, and after due notice, has within the Judicial District of this Court and elsewhere within the United States, infringed each of the aforesaid Letters Patent

and contributed to the infringement thereof by making and/or causing to be made, by using and/or causing to be used, and selling and/or causing to be sold in this Judicial District and elsewhere within the United States, Pistons for Internal Combustion Engines embodying jointly and severally the inventions of said Letters Patent and in infringement thereof.

That in so infringing, defendants have realized and received great gains and profits which should, and otherwise would, have been received by plaintiffs, each and both of them, and defendants, and each and both of them, have correspondingly inflicted on plaintiffs great loss and damage, but to what extent plaintiffs cannot now set forth and therefore pray discovery with respect thereto; that plaintiffs fear and have reason to fear that defendants will continue their aforesaid infringing acts to an even greater extent unless enjoined by this Honorable Court; and defendants, and each of them, have and will thereby induce others to venture to infringe the said Letters Patent aforesaid, to the irreparable injury of plaintiffs.

30.

Because of these premises, plaintiffs are without adequate or sufficient remedy at law and therefore bring this suit in equity.

WHEREFORE, the plaintiffs pray:

First. That a writ of subpoena ad respondum may issue out of and under the seal of this Court requiring each and both of said defendants, The Simmons Manufacturing Company and Sterling Products Corporation, to appear and make answer to this Bill of Complaint, but not under oath, answer under oath being hereby expressly waived, to the best and utmost of their knowledge, information and belief and to do and perform such things as to this Court may seem meet and just;

Second. That this Court may grant an injunction, perpetual as well as temporary, enjoining each and both of said defendants, The Simmons Manufacturing Company and Sterling Products Corporation, as well as each of the directors, officers, associates, successors, agents, attorneys and employees, and every person acting for or on the behalf of each and/or both of said defendants, from further infringing or contributing to the infringement of any and/or each of said Letters Patent;

Third. That said defendants, The Simmons Manufacturing Company and Sterling Products Corporation, and each and both of them, may be required to account before a Master in the usual manner of accountings for the gains, profits and advantages due to and arising out of their aforesaid infringements and contributory infringements herein complained about, as well as the damages sustained by plaintiffs, by reason of said infringements;

Fourth. That said defendants, The Simmons Manufacturing Company and Sterling Products Corporation, each and both of them, be required to pay over to plaintiffs, the gains and profits so accounted for and also the damages sustained by plaintiffs as the result of said infringements and contributory infringements;

Fifth. That the defendants, each and both of them, be decreed to pay the costs, charges and disbursements of this suit;

Sixth. That the plaintiffs may have such other and further relief as the equity of the case may require, and as to this Honorable Court may seem just and proper.

THE CLEVELAND TRUST COMPANY,
By: .....,
Vice-President.

CHRYSLER CORPORATION,
By: .....,
Vice-President, The Cleveland Trust Company.

.....,
Solicitor for Plaintiffs.

AFFIDAVIT

STATE OF OHIO,
COUNTY OF CUYAHOGA, ss.

On this 1st day of August, 1931, before the undersigned, a Notary Public within and for the County and State aforesaid, personally appeared R. A. Malm and made oath that he is the Vice President of The Cleveland Trust Company, the above named complainant, that he has read the foregoing Bill of Complaint, and knows the contents thereof, and that the same is true, except as to those matters stated on information and belief, and as to those matters he believes it to be true.

D. F. KING,
Notary Public.

DEFENDANTS' EXHIBIT 5-J.

Letter, dated Oct. 17, 1932 from Anna Landon Duke to J. H. Bruninga.

(Filed January 27, 1934.)

Iowa City, Iowa, Oct. 17, 1932

Mr. J. H. Bruninga,
St. Louis, Mo.

Dear Sir:

I have carefully gone over the sheets of record which you sent me, and have placed my initials "A.L.D." on the backs of the ones that I recognize as work done by me at the M. K. Weems place.

Trusting that this will give you the needed help, I am,

Yours truly,

(Mrs.) Anna Landon Duke.

THE ADJUSTABLE GAS ENGINE PISTON.

This piston is made for the purpose of preventing what is called piston knock and flutter. It can be adjusted according to wear and last the life time of the motor being quiet without knock or flutter. This prevents reboring and new pistons.

It also can be ground in according to the repairman's or builder's desire; which cuts away all rough surfaces and then be adjusted to a more perfect fit.

As experience has taught, a lap joint or leak proof ring with a good fit in grooves worn to fit cylinder snugly will prevent leakage and give better compression than new rings.

This piston is to be fitted with either such rings.

The cross head bushing at No. 9 are also adjustable by taking out bushing and cutting slot, placing in a few liners, the bushing may be lined up to fit cross head pin then drawn up with take-up nut No. 8 which follows bushing. This nut is securely held in place with cotter pin No. 10.

The bushing seat is reinforced to top of piston as shown in drawing and model A. B.

This piston can also be made with plain bushings if desired.

Small pins are inserted at upper ring grooves to prevent rings from shifting.

Two small holes are drilled at ends of slot No. 3.

Slot 4 is cut diagonally for two purposes first to prevent scar 2nd for the convenience of getting at upper & lower piston adjustment.

The piston adjustment is taken up in two places 1st the upper adjustment shown at "C", 2nd lower adjustment shown at "D".

This adjustment is composed of a stud with jam nut and lock washers on each side of lug.

The piston is to be made of cast steel or some malleable metals.

The cross head pin bushings are to be made of bronze or brass.

The take-up nuts, studs, and jam nuts are to be made of soft steel.

The lock washers to be made of tempered steel.

The piston is to be placed in motor as shown at motor view. This being for the purpose of keeping solid side of piston on explosion wall or the side of cylinder where the explosion or cumbustion forces piston against cylinder wall when on the power stroke. Looking from the front, slot to be on the right side. See view or motor view at right of sketch.

Mr. Walter L. Schoengarth,
Ironwood, Mich.

Dear Sir:

In further reply to your letter of May 4th we have to inform you that we have completed the search on the Adjustable Piston, and found nothing which would, in our opinion, prevent the grant of a patent to you.

Upon receipt of your instructions to proceed and the remittance of the first installment of fees amounting to Twenty Dollars ($20.00) we will prepare the papers and send them to you for your review and execution.

Thanking you for the favor and awaiting your further commands, we remain

Yours very truly,

LOUIS BAGGER & Co.

DEPARTMENT OF COMMERCE

UNITED STATES PATENT OFFICE

To all persons to whom these presents shall come, Greeting:

THIS IS TO CERTIFY that the annexed is a true copy from the records of this office of the Petition, Specification, Oath and Drawings, as originally filed, October 1, 1915, Serial Number 53,625 in the matter of the Letters Patent of Walter L. Schoengarth, Number 1,174,092, Granted March 7, 1916, for Improvement in Adjustable Gas-Engine Pistons.

IN TESTIMONY WHEREOF I have hereunto set my hand and caused the seal of the Patent Office to be affixed, at the City of Washington, this twenty-first day of March, in the year of our Lord one thousand nine hundred and thirty-three and of the Independence of the United States of America the one hundred and fifty-seventh.

THOMAS E. ROBERTSON,

(Seal) *Commissioner of Patents.*

ATTEST:

D. E. WILSON,

Chief of Division.

PETITION

(15 Rec'd Oct .... 1915 C. U. S. Pat. Office)

To the Commissioner of Patents:

Your petitioner WALTER L. SCHOENGARTH, a citizen of the United States and a resident of Ironwood, in the County of Gogebic, and State of Michigan, whose Post-office address is:—202 Fredrick St., Ironwood, Michigan, prays that Letters Patent may be granted to him for the improvement in ADJUSTABLE GAS-ENGINE PISTONS, as set forth in the annexed specification.

And he hereby appoints Vernon E. Hodges and Watts T. Estabrook, doing business as:—Louis Bagger & Co., Barrister Bldg.,—635 F Street N. W., Washington, D. C., his attorneys, with full power of substitution and revocation, to prosecute this application, to make alterations and amendments therein, to sign his name to the drawings, to receive the Letters Patent, and to transact all business in the United States Patent Office connected therewith.

Signed at Ironwood, in the County of Gogebic, and State of Michigan, this 27th day of July, 1915.

Sign full name: WALTER L. SCHOENGARTH.

(U. S. I. R. Documentary Stamp 25 Cents)

SPECIFICATION

To all whom it may concern:

Be it known, That I, WALTER L. SCHOENGARTH, a citizen of the United States, residing at Ironwood, in County of Gogebic, and State of Michigan, have invented certain new and useful improvements in ADJUSTABLE GAS-ENGINE PISTONS, of which the following is a specification:

53625—1

W. L. S.—Inv. 835
L. B. & Co.—Atty

My invention relates to an Adjustable Gas Engine Piston, the object being to prevent what is called a piston knock and flutter, and in my present invention provision is made for adjusting the size of the piston according to rule, so that it can be made to last the lifetime of the motor. The result is, it is quiet, and without knock or flutter, thus rendering re-boring and new pistons unnecessary, prolonging the life and usefulness of the motor, and greatly reducing the cost of repair, etc.

My improved piston can be ground according to the ideas of the repairman or builder, doing away with all rough surfaces, after which it may be adjusted to a perfect fit in the cylinder-bore.

With these objects in view, my present invention comprises a piston which is transversely and diagonally slotted on one side, with means inside for expanding the piston to fit perfectly the bore of the cylinder. It further consists in bushings for the cross-head pin, which are capable of quick and accurate adjustment to take up wear.

In the accompanying drawings:—

Figure 1 is a view of the motor in vertical section,

1. 53625

showing the position of piston;

Figure 2 is a side elevation of the piston;

Figure 3 is a sectional view on the line 3—3 of Figure 2;

Figure 4 is an end view looking into the piston; and

Figure 5 is a view of the wrench for adjusting nuts.

A, represents the piston, it being provided with the circumferential ring-grooves 1, 1, adapted to receive packing-rings, and ring-pins 2 are provided in these grooves to prevent the rings from shifting.

The piston has two slots, namely a transverse slot 3 cut nearly half-way thereacross on one side, and at each end of which a small hole 3′ is drilled, and a diagonal slot 4 extending from the point near the center of the transverse slot 3 to one end of the piston. This slot is cut diagonally for two purposes, first, to prevent scar, and second, for convenience in making the upper and lower piston adjustment. The piston adjustment is taken up in two places, namely at the upper end of the diagonal slot and also at the lower end. The adjustment is through the two screws or studs 5 and 5′ which turn in threaded orifices in the lugs C and D located at the upper and lower ends respecively of the piston, the inner ends of these screws or studs turning in the holes in the abutments E and F respectively.

Access is gained to these screws by a screw-driver inserted through the holes H and I respectively, and jamb-nuts 7 on these screws or studs have notched edges to receive the wrench 13 by which they are turned up

2. 53625

tight by the lock-washer 7 against the lugs C and D.

To expand the piston to the size required, the nuts are loosened, and the screws are turned in the lugs to get the required expansion, after which the jamb-nuts are tightened up against the lugs, and in this way the piston may be re-fitted to the bore of the cylinder at any time without the necessity of re-boring or the purchase and substitution of new pistons. In fact this adjustment may be accomplished without removing the piston from the cylinder.

The ends of the cross-head pin 12 are supported in cross-head bushings 9, 9. These are preferably made of

bronze or brass, and split longitudinally, having an external taper so that they are compressible around the ends of the cross-head pins by means of the take-up bushing nuts 8 at either end, and a cotter-pin 10 is inserted to hold the bushing 8 against turning. It is evident that a plain bushing, such as shown in 11, might be used instead of a tapering, adjustable one as described. The bushing-seats 14 are preferably reinforced at top of piston, as shown in Figure 3.

The piston is placed in the motor, as shown in Figure 1, that is to say with the solid side of the piston toward the expansion wall or the side of cylinder where the explosion or combustion takes place and forces the piston against the cylinder wall when on the power stroke, thus bringing the slots 3 and 4 on the right side of the engine.

Obviously more or less slight changes might be made in the form and arrangement of the several parts described without departing from the spirit and scope of

838

my invention, and hence I do not wish to limit myself to the exact construction herein set forth, but:—

I claim:

1. An expansible piston having a transverse and longitudinal slot therethrough, and adjustable locking means located internally for expanding the piston.

2. A piston transversely and longitudinally slotted, and screws supported on one side of the longitudinal slot and engaging a member on the opposite side thereof, whereby when turned in one direction the piston is expanded, and when turned in the opposite direction it contracts by its own elasticity.

3. A piston transversely and longitudinally slotted, and screws supported on one side of the longitudinal slot and engaging a member on the opposite side thereof, whereby when turned in one direction the piston is expanded, and when turned in the opposite direction it contracts by its own elasticity, and means for locking said adjusting means.

4. A piston transversely and longitudinally slotted, and having holes therethrough on one side of the longi-

839

tudinal slot, lugs and abutments located on opposite sides of the longitudinal slots and having orifices therein in alignment with the holes in the pistons, and screws extending through said orifices in the lugs and abutments, accessible through holes in the piston, for adjusting the piston.

5. A piston transversely and longitudinally slotted, and having holes therethrough on one side of the longitudinal slot, lugs and abutments located on opposite sides of the longitudinal slots and having orifices therein in alignment with the holes in the pistons, screws extending through said orifices in the lugs and abutments, accessible through holes in the piston, for adjusting the piston, and lock-nuts located on the screws on opposite sides of the lugs for locking the screw against turning to hold the piston in its adjusted position.

6. The combination with a piston, of a cross-head pin, a tapering adjustable bushing, and a take-up bushing-nut for moving the bushing endwise and contracting it around the cross-head pin.

7. The combination with a piston of a cross-head pin, a tapering adjustable bushing, and a take-up bushing-nut for moving the bushing endwise and contracting it around the cross-head pin, the bushing-nut externally screw-threaded to turn in a threaded orifice concentric with the outer end of the bushing, and means for locking the bushing-nut against turning.

DEFENDANTS' EXHIBIT 5-K$_{11}$.

Letter, dated April 2, 1917, from Louis Bagger & Co. to Walter Schoengarth.

(Filed January 27, 1934.)

Louis Bagger & Co.
Patent Attorneys
Barrister Building
635 F Street N. W.
Washington, D. C.

Washington, D. C.
April 2, 1917.

Mr. Walter Schoengarth,
202 Fredrick Street,
Ironwood, Mich.

Dear Sir:

Yours of the 26th ult., and express package containing model of New Form Piston just received and in reply, we are pleased to say that this construction, in our judgment, will come clearly within the terms of your claim 1 which calls for a piston having transverse and longitudinal slots and adjustable means located internally for expanding the piston. Your bolts or screws, have this function and they are located to all intents and purposes internally and we believe the claim fully covers this change.

Notwithstanding this however, we advocate an additional patent in a case like this because you really have a new and probably patentable feature in the way of these bolts and nuts, which by being located in the slots act, when tightened to spread or expand the piston.

The point is this, if you do not patent this there is always more or less danger of someone else doing so, even though in making such a thing they would infringe your patent and it is always far better to have too many patents than too few.

If we have not made all perfectly clear, let us know and we shall write you more at length.

Trusting you have gotten where you have begun to realize something on this invention, we remain.

Very truly yours,

Louis Bagger & Co.

[Case No. 4046.]

UNITED STATES OF AMERICA,
NORTHERN DISTRICT OF OHIO,
EASTERN DIVISION, SS.

Record of the proceedings of the District Court of the United States within and for the Eastern Division of the Northern District of Ohio, in the causes and matters hereinafter stated, the same being finally disposed of at a regular term of said court begun and held at the City of Cleveland, in said district, on the first Tuesday in April, being the third day of said month, in the year of our Lord one thousand nine hundred and thirty-four and in the one hundred and fifty-eighth year of the Independence of the United States of America, to-wit, on Friday, the 27th day of July, A. D. 1934.

Honorable PAUL JONES,
United States District Judge.

THE CLEVELAND TRUST COMPANY,
CHRYSLER CORPORATION,
vs.
THE ABERDEEN MOTOR SUPPLY COMPANY.
} No. 4046 EQUITY.

Said action was commenced on the 17th day of October, A. D. 1931 and proceeded to final disposition at the term and day above written and during the progress thereof pleadings and papers were filed, process was issued and returned and orders of the court were made and entered in the order and on the dates hereinafter stated, to-wit:

BILL OF COMPLAINT.

(Filed October 17, 1931.)

[Case No. 4046.]

The Bill of Complaint in Case No. 4046 is identical in wording, except as regards the name of the Defendant, with the Bill of Complaint in Case No. 4045 printed at pages 2 to 13, both inclusive, of Vol. I.

MOTION OF DEFENDANT, THE ABERDEEN MOTOR SUPPLY COMPANY, FOR FURTHER AND BETTER STATEMENT AND FURTHER PARTICULARS.

(Filed November 9, 1931.)

[Case No. 4046.]

This Motion in Case No. 4046 is identical in wording, except as regards the name of the Defendant, with a similar Motion in Case No. 4045 printed at pages 14 and 15, both inclusive, of Vol. I.

ORDER ON MOTION OF DEFENDANT, THE ABERDEEN MOTOR SUPPLY COMPANY, FOR FURTHER AND BETTER STATEMENT, AND FURTHER PARTICULARS.

(Entered December 30, 1931 by Paul Jones, Judge.)

[Case No. 4046.]

This Order in Case No. 4046 is identical in wording, except as regards the name of the Defendant, with a similar Order in Case No. 4045 printed at page 16 of Vol. I.

PLAINTIFFS' BILL OF PARTICULARS.

(Filed January 8, 1932.)

[Case No. 4046.]

Plaintiffs' Bill of Particulars in this case is identical in wording, except as regards the name of the Defendant, with Plaintiffs' Bill of Particulars in Case No. 4045 printed at pages 16 and 17, both inclusive, of Vol. I.

PETITION OF JOHN H. BRUNINGA FOR LEAVE TO ENTER HIS SPECIAL APPEARANCE, IN ORDER TO ENTER A SPECIAL APPEARANCE ON BEHALF OF STERLING PRODUCTS CORPORATION, FOR THE SOLE AND ONLY PURPOSE OF OBJECTING TO THE JURISDICTION.

(Filed November 9, 1931.)

[Case No. 4046.]

This Petition in Case No. 4046, is identical in wording with a similar Petition in Case No. 4045 printed at pages 18 to 20; both inclusive, of Vol. I.

PRINTER'S NOTE:

The Letters attached to the foregoing Petition in Case No. 4046 are identical with those attached to the Petition in Case No. 4045, printed at pages 21 to 25, both inclusive, of Vol. I.

ORDER OF COURT GRANTING PETITION OF JOHN H. BRUNINGA FOR LEAVE TO ENTER SPECIAL APPEARANCE OF STERLING PRODUCTS, TO OBJECT TO JURISDICTION.

(Entered December 30, 1931 by Paul Jones, Judge.)

[Case No. 4046.]

This Order in Case No. 4046 is identical with the similar Order in Case No. 4045 printed at page 25 of Vol. I.

ANSWER OF DEFENDANT, THE ABERDEEN MOTOR SUPPLY COMPANY, TO BILL OF COMPLAINT.

(Filed February 1, 1932.)

[Case No. 4046.]

The Answer to the Bill of Complaint in Case No. 4046 is identical in wording, except as regards the name of the Defendant, with a similar Answer in Case No. 4045 printed at pages 26 to 41, both inclusive, of Vol. I.

NOTICE BY DEFENDANT, THE ABERDEEN MOTOR SUPPLY COMPANY, OF INTENTION TO TAKE DEPOSITIONS.

(Filed February 15, 1932.)

[Case No. 4046.]

This Notice in Case No. 4046 is identical in wording, except as regards the name of the Defendant, with a similar Notice in Case No. 4045 printed at page 41 of Vol. I.

SUPPLEMENTAL NOTICES BY DEFENDANT, THE ABERDEEN MOTOR SUPPLY COMPANY, OF INTENTION TO TAKE DEPOSITIONS, ATTACHED TO VENNER ET AL. DEPOSITIONS.

(Filed January 9, 1933.)

[Case No. 4046.]

The Supplemental Notices in Case No. 4046 are identical in wording, except as regards the name of the Defendant, with similar Supplemental Notices in Case No. 4045 printed at page 42 of Vol. I.

ORDER FOR REFERENCE TO AND APPOINTMENT OF SPECIAL MASTER.

(Entered November 7, 1932 by Paul Jones, Judge.)

[Case No. 4046.]

This Order in Case No. 4046 is identical in wording with a similar Order in Case No. 4045 printed at pages 43 and 44, both inclusive, of Vol. I.

STIPULATION OF PLAINTIFFS AND DEFENDANT, THE ABERDEEN MOTOR SUPPLY COMPANY, CONSOLIDATING CAUSE NO. 4046 WITH CAUSES NOS. 4045 AND 4047 FOR TRIAL.

(Filed January 11, 1933.)

[Case No. 4046.]

This Stipulation in Case No. 4046 is identical in wording, except as regards the Captions and Numbers of the cases referred to therein, with the similar Stipulation in Case No. 4045, printed at pages 45 and 46, both inclusive, of Vol. I.

ORDER GRANTING STIPULATION CONSOLIDATING EQUITY CAUSE NO. 4046 WITH CAUSES NOS. 4045 AND 4047 FOR TRIAL, ETC.

(Entered January 11, 1933 by Paul Jones, Judge.)

[Case No. 4046.]

This Order in Case No. 4046 is identical in wording, except as regards the Captions and Numbers of the case referred to therein, with the similar Order in Case No. 4045 printed at pages 46 and 47, both inclusive, of Vol. I.

AMENDMENT TO ANSWER OF DEFENDANT, THE ABERDEEN MOTOR SUPPLY COMPANY.

(Filed April 19, 1933.)

[Case No. 4046.]

This Amendment to Answer in Case No. 4046 is identical in wording, except as regards the name of the Defendant, with a similar Amendment to Answer in Case No. 4045 printed at page 48 of Vol. I.

STIPULATION OF PLAINTIFFS AND DEFENDANT, THE ABERDEEN MOTOR SUPPLY COMPANY, RE NARRATIVE OF TRANSCRIPT.

(Filed October 26, 1934.)

[Case No. 4046.]

This Stipulation in Case No. 4046 is identical in wording, except as regards the name of the Defendant, with a similar Stipulation in Case No. 4045 printed at page 49 of Vol. I.

ORDER GRANTING STIPULATION OF PLAINTIFFS AND DEFENDANT, THE ABERDEEN MOTOR SUPPLY COMPANY, FOR FILING NARRATIVE FORM TESTIMONY IN ONE CAUSE WITH REFERENCE THERETO IN EACH OF OTHER TWO CAUSES.

(Entered October 26, 1934 by Paul Jones, Judge.)

[Case No. 4046.]

This Order in Case No. 4046 is identical in wording, except as regards the name of the Defendant, with the similar Order in Case No. 4045 printed at page 49 of Vol. I.

ORDER APPROVING NARRATIVE FORM OF TESTIMONY.

(Entered February 26, 1935 by Paul Jones, Judge.)

[Case No. 4046.]

This Order in Case No. 4046 is identical in wording with the similar Order in Case No. 4045 printed at page 50 of Vol. I.

ACKNOWLEDGMENT OF SERVICE OF NARRATIVE FORM OF TESTIMONY.

(Filed February 26, 1935.)

[Case No. 4046.]

This Acknowledgment of Service in Case No. 4046 is identical in wording with a similar Acknowledgment of Service in Case No. 4045 printed at page 51, Vol. I.

NARRATIVE FORM OF TESTIMONY.

(Filed February 26, 1935.)

[Case No. 4046.]

The Narrative Form of Testimony in Case No. 4046 is identical in every respect with that in Case No. 4045 printed at pages 51 to 587, both inclusive, of Vol. I, and pages 599 to 1091, both inclusive, of Vol. II.

PLAINTIFFS' EXHIBITS.

The Exhibits of Plaintiffs called for by the Praecipe in Case No. 4046 and those withdrawn by the Order of Withdrawal in Case No. 4046 are identical with those included in or withdrawn from Case No. 4045; those included appear on pages 1321 to 1584, both inclusive, of Vol. III.

DEFENDANTS' EXHIBITS.

The Exhibits of Defendants called for by the Praecipe in Case No. 4046 and those withdrawn by the Order of Withdrawal in Case No. 4046 are identical with those included in or withdrawn from Case No. 4045; those included appear on pages 1585 to 1808, both inclusive, of Vol. III and pages 1809 to 2329, both inclusive, of Vol. IV.

The Order of the Withdrawal of Exhibits in Case No. 4046 is identical in wording with that in Case No. 4045, which appears on pages 1280 to 1281, both inclusive, of Vol. II.

REPORT OF WILLIAM B. WOODS, SPECIAL MASTER.

(Filed January 27, 1934.)

[Case No. 4046.]

The Report of the Special Master in Case No. 4046 is identical in wording with that in Case No. 4045 printed on pages 1092 to 1189, both inclusive, of Vol. II.

PLAINTIFFS' EXCEPTIONS TO THE REPORT OF THE SPECIAL MASTER.

(Filed February 26, 1934.)

[Case No. 4046.]

Plaintiffs' Exceptions to the Report of the Special Master in Case No. 4046 are identical in wording with those in Case No. 4045 printed on pages 1190 to 1228, both inclusive, of Vol. II.

MEMORANDUM ON EXCEPTIONS TO MASTER'S REPORT.

(Filed July 6, 1934.)

[Case No. 4046.]

The Memorandum of Exceptions to Master's Report in Case No. 4046 is identical in wording with that in Case No. 4045, printed on page 1229 of Vol. II.

FINAL DECREE.

(Filed July 27, 1934.)

[Case No. 4046.]

The Final Decree in Case No. 4046 is identical in wording with that in Case No. 4045 printed on page 1230 of Vol. II.

PETITION FOR APPEAL.

(Filed October 17, 1934.)

[Case No. 4046.]

The Petition for Appeal in Case No. 4046 is identical in wording with that in Case No. 4045 printed on page 1231 of Vol. II.

ORDER ALLOWING APPEAL.

(Entered October 17, 1934 by Paul Jones, Judge.)

[Case No. 4046.]

The Order Allowing Appeal in Case No. 4046 is identical in wording with that in Case No. 4045 printed on pages 1231 and 1232, both inclusive, of Vol. II.

ASSIGNMENT OF ERRORS.

(Filed October 17, 1934.)

[Case No. 4046.]

The Assignment of Errors in Case No. 4046 is identical in wording with that in Case No. 4045 printed on pages 1232 to 1250, both inclusive, of Vol. II.

CITATION.

(Filed October 20, 1934.)

[Case No. 4046.]

The Citation in Case No. 4046 is identical in wording, except as regards the name of the Appellee, with that in Case No. 4045 printed on page 1251 of Vol. II.

BOND ON APPEAL.

(Filed October 23, 1934.)

[Case No. 4046.]

The Bond on Appeal in Case No. 4046 is identical in wording, except as regards the name of the Appellee, with that in Case No. 4045 printed on pages 1253 and 1254, both inclusive, of Vol. II.

ORDERS EXTENDING TIME.

[Case No. 4046.]

The Orders in Case No. 4046 Extending Time for Lodging the Narrative, filing Praecipe and filing the Transcript of Record in the United States Circuit Court of Appeals are identical with those in Case No. 4045 printed on pages 1255 to 1265, both inclusive, of Vol. II.

These Orders of Extension are abbreviated as follows:

Time Extended	*For Filing Praecipe and/or Lodging Narrative*	*For Filing Record In U. S. C. C. of A.*
From	*To*	*To*
Oct. 26/34	Nov. 24/34	Dec. 16/34
Nov. 22/34	Dec. 14/34	Dec. 26/34
Dec. 13/34	Dec. 21/34	.....
Dec. 20/34	Dec. 31/34	Jan. 25/35
Dec. 31/34	Jan. 14/35	.....
Jan. 14/35	Jan. 28/35	Feb. 23/35
Jan. 23/35	Feb. 18/35	.....
Feb. 18/35	Feb. 25/35	Mar. 25/35
Feb. 25/35	Mar. 15/35	.....
Mar. 15/35	Apr. 15/35	Apr. 25/35
Apr. 16/35	May 6/35	May 16/35
May 14/35	.....	June 15/35
June 12/35	.....	Aug. 15/35
Aug. 15/35	.....	Sept. 30/35

STIPULATION THAT APPEALS IN CAUSES NOS. 4045, 4046 AND 4047 BE CONSOLIDATED IN ONE PRINTED TRANSCRIPT OF RECORD, THAT EXHIBITS USED THEREIN MAY BE USED IN EACH OF SAID CAUSES AND THAT REPETITION OF SIMILAR PLEADINGS IN EACH BE ELIMINATED.

(Filed March 2, 1935.)

[Case No. 4046.]

This Stipulation in Case No. 4046 is identical in wording with that in Case No. 4045 printed on page 1266 of Vol. II.

ORDER CONSOLIDATING APPEALS IN ONE PRINTED TRANSCRIPT OF RECORD, THAT EXHIBITS USED THEREIN MAY BE USED IN EACH OF SAID CAUSES, AND FURTHER ORDERING ELIMINATION OF REPETITION OF SIMILAR PLEADINGS IN EACH CAUSE.

(Entered March 2, 1935 by Paul Jones, Judge.)

[Case No. 4046.]

This Order in Case No. 4046 is identical in wording with that in Case No. 4045 printed on page 1267 of Vol. II.

STIPULATION RE DIGEST OF EXHIBITS.

(Filed May 4, 1935.)

[Case No. 4046.]

This Stipulation in Case No. 4046 is identical in wording with that in Case No. 4045 printed on page 1267 of Vol. II.

ORDER GRANTING STIPULATION RE DIGEST OF EXHIBITS.

(Entered May 4, 1935 by Paul Jones, Judge.)

[Case No. 4046.]

This Order in Case No. 4046 is identical in wording with that in Case No. 4045 printed on page 1268 of Vol. II.

PRAECIPE.

(Filed May 6, 1935.)

[Case No. 4046.]

The Praecipe in Case No. 4046 is identical in wording with that in Case No. 4045 printed on pages 1269 to 1272, both inclusive, of Vol. II.

STIPULATION RE CERTIFICATION OF RECORD.

(Filed May 6, 1935.)

[Case No. 4046.]

The Stipulation Re Certification of Record in Case No. 4046 is identical in wording with that in Case No. 4045 printed on page 1273 of Vol. II.

DEFENDANTS' MOTION FOR LEAVE TO ADD TO THE RECORD IN THE ABOVE-ENTITLED CASE DEFENDANTS' COUNTER PRAECIPE AND CERTAIN LETTERS.

(Filed May 14, 1935.)

[Case No. 4046.]

This Motion in Case No. 4046 is identical in wording with that in Case No. 4045 printed on pages 1273 to 1277, both inclusive, of Vol. II.

ORDER DENYING MOTION OF DEFENDANTS FOR LEAVE TO ADD TO RECORD DEFENDANTS' COUNTER PRAECIPE AND CERTAIN LETTERS.

(Entered May 15, 1935 by Paul Jones, Judge.)

[Case No. 4046.]

This Order in Case No. 4046 is identical in wording with that in Case No. 4045 printed on page 1277 of Vol. II.

PETITION TO SUPPLY LAST EIGHT PAGES MISSING FROM PLAINTIFFS' EXHIBIT 13 IN THE ABOVE CAUSE ON APPEAL.

(Filed June 18, 1935.)

[Case No. 4046.]

This Petition in Case No. 4046 is identical in wording with that in Case No. 4045 printed on page 1278 of Vol. II.

ORDER GRANTING LEAVE TO SUPPLY LAST EIGHT PAGES OF PLAINTIFFS' EXHIBIT NO. 13.

(Entered June 18, 1935 by Paul Jones, Judge.)

[Case No. 4046.]

This Order in Case No. 4046 is identical in wording with that in Case No. 4045 printed on page 1278 of Vol. II.

DEFENDANTS' COUNTER PRAECIPE.

(Filed June 27, 1935.)

[Case No. 4046.]

Defendants' Counter Praecipe in Case No. 4046 is identical in wording with that in Case No. 4045 printed on page 1279 of Vol. II.

ORDER SETTLING CONTENTS OF RECORD.

(Entered July 6, 1935 by Paul Jones, Judge.)

[Case No. 4046.]

Order Settling Contents of Record in Case No. 4046 is identical in wording with that in Case No. 4045 printed on page 1279 of Vol. II.

ORDER FOR WITHDRAWAL OF EXHIBITS.

(Entered September 4, 1935 by Paul Jones, Judge.)

[Case No. 4046.]

Order for Withdrawal of Exhibits in Case No. 4046 is identical in wording with that in Case No. 4045 printed on pages 1280 and 1281, both inclusive, of Vol. II.

CAPTION.

[Case No. 4047.]

UNITED STATES OF AMERICA,
NORTHERN DISTRICT OF OHIO,
EASTERN DIVISION, ss.

Record of the proceedings of the District Court of the United States within and for the Eastern Division of the Northern District of Ohio, in the cause and matter hereinafter stated, the same being finally disposed of at a regular term of said court begun and held at the City of Cleveland, said district, on the first Tuesday in April, being the third day of said month, in the year of our Lord one thousand nine hundred and thirty-four and in the one hundred and fifty-eighth year of the Independence of the United States of America, to-wit, on Friday, the 27th day of July A. D. 1934.

Honorable PAUL JONES,
United States District Judge.

THE CLEVELAND TRUST COMPANY,
CHEVISLER CORPORATION,

vs.

THE F. E. ROWE SALES COMPANY.

No. 4047 EQUITY.

Said action was commenced on the 17th day of October, A. D. 1931 and proceeded to final disposition at the term and day above written and during the progress thereof pleadings and papers were filed, process was issued and returned, and orders of the court were made and entered in the order and on the dates hereinafter stated, to-wit:

BILL OF COMPLAINT.

(Filed October 17, 1931.)

[Case No. 4047.]

The Bill of Complaint in Case No. 4047 is identical in wording, except as regards the name of the Defendant, with the Bill of Complaint in Case No. 4045 printed at pages 2 to 13, both inclusive, of Vol. I.

MOTION OF DEFENDANT, THE F. E. ROWE SALES COMPANY, FOR FURTHER AND BETTER STATEMENT AND FURTHER PARTICULARS.

(Filed November 9, 1931.)

[Case No. 4047.]

This Motion in Case No. 4047 is identical in wording, except as regards the name of the Defendant, with a similar Motion in Case No. 4045 printed at pages 14 and 15, both inclusive, of Vol. I.

ORDER ON MOTION OF DEFENDANT, THE F. E. ROWE SALES COMPANY, FOR FURTHER AND BETTER STATEMENT AND FURTHER PARTICULARS.

(Entered December 30, 1931 by Paul Jones Judge.)

[Case No. 4047.]

This Order in Case No. 4047 is identical in wording, except as regards the name of the Defendant, with a similar Order in Case No. 4045 printed at page 16 of Vol. I.

PLAINTIFFS' BILL OF PARTICULARS.

(Filed January 8, 1932.)

[Case No. 4047.]

Plaintiffs' Bill of Particulars in this case is identical in wording, except as regards the name of the Defendant, with Plaintiffs' Bill of Particulars in Case No. 4045 printed at pages 16 and 17, both inclusive, of Vol. I.

PETITION OF JOHN H. BRUININGA FOR LEAVE TO ENTER SPECIAL APPEARANCE, IN ORDER TO ENTER A SPECIAL APPEARANCE ON BEHALF OF STERLING PRODUCTS CORPORATION, FOR THE SOLE AND ONLY PURPOSE OF OBJECTING TO THE JURISDICTION.

(Filed November 9, 1951.)

[Case No. 4047.]

This Petition in Case No. 4047, is identical in wording with a similar Petition in Case No. 4045 printed at pages 18 to 20, both inclusive, of Vol. I.

PRINTER'S NOTE:

The Letters attached to the foregoing Petition in Case No. 4047 are identical with those attached to the Petition in Case No. 4045, printed at pages 21 to 25, both inclusive, of Vol. I.

ORDER OF COURT GRANTING PETITION OF JOHN H. BRUININGA FOR LEAVE TO ENTER SPECIAL APPEARANCE OF STERLING PRODUCTS, TO OBJECT TO JURISDICTION.

(Entered December 30, 1951 by Paul Jones, Judge.)

[Case No. 4047.]

This Order in Case No. 4047 is identical with the similar Order in Case No. 4045 printed at page 25 of Vol. I.

ANSWER OF DEFENDANT, HERT. K. ROWE SALES COMPANY, TO BILL OF COMPLAINT.

(Filed February 1, 1952.)

[Case No. 4047.]

The Answer to the Bill of Complaint in Case No. 4047 is identical in wording, except as regards the name of the Defendant, with a similar Answer in Case No. 4045 printed at pages 26 to 31, both inclusive, of Vol. I.

NOTICE BY DEFENDANT, THE F. E. BOWE SALES COMPANY, OF INTENTION TO TAKE DEPOSITIONS.

(Filed February 15, 1932.)

[Case No. 4047.]

This Notice in Case No. 4047 is identical in wording, except as regards the name of the Defendant, with a similar Notice in Case No. 4045 printed at page 41 of Vol. I.

SUPPLEMENTAL NOTICES BY DEFENDANT, THE F. E. BOWE SALES COMPANY, OF INTENTION TO TAKE DEPOSITIONS, ATTACHED TO WEEKES ET AL. DEPOSITIONS.

(Filed January 9, 1933.)

[Case No. 4047.]

The Supplemental Notices in Case No. 4047 are identical in wording, except as regards the name of the Defendant, with similar Supplemental Notices in Case No. 4045 printed at page 42 of Vol. I.

ORDER FOR REFERENCE TO AND APPOINTMENT OF SPECIAL MASTER.

(Entered November 7, 1933 by Paul Jones, Judge.)

[Case No. 4047.]

This Order in Case No. 4047 is identical in wording, with a similar Order in Case No. 4045 printed at pages 43 and 44, both inclusive, of Vol. I.

STIPULATION OF PLAINTIFF AND DEFENDANT, THE F. E. BOWE SALES COMPANY, CONSOLIDATING CAUSES NO. [illegible] AND [illegible] FOR TRIAL.

(Filed January 11, 1933.)

[Case No. 4047.]

This Stipulation in Case No. 4047 is identical in wording, except as regards the Captions and Numbers of the cases referred to therein, with the similar Stipulation in Case No. 4045, printed at pages 45 and 46, both inclusive, of Vol. I.

ORDER GRANTING STIPULATION CONSOLIDATING EQUITY CAUSE NO. 4047 WITH CAUSES NOS. 4045 AND 4046 FOR TRIAL, ETC.

(Entered January 11, 1933 by Paul Jones, Judge.)

(Case No. 4047.)

This Order in Case No. 4047 is identical in wording, except as regards the Captions and Numbers of the case referred to therein, with the similar Order in Case No. 4045 printed at pages 46 and 47, both inclusive, of Vol. I.

AMENDMENT TO ANSWER OF DEFENDANT, THE F. E. BOWE SALES COMPANY.

(Filed April 19, 1933.)

(Case No. 4047.)

This Amendment to Answer in Case No. 4047 is identical in wording, except as regards the name of the Defendant, with a similar Amendment to Answer in Case No. 4045 printed at page 48 of Vol. I.

STIPULATION OF PLAINTIFF AND DEFENDANT, THE F. E. BOWE SALES COMPANY, RE NARRATIVE OF TRANSCRIPT.

(Filed October 26, 1934.)

(Case No. 4047.)

This Stipulation in Case No. 4047 is identical in wording, except as regards the name of the Defendant, with a similar Stipulation in Case No. 4045 printed at page 49 of Vol. I.

ORDER GRANTING STIPULATION OF PLAINTIFF AND DEFENDANT, THE F. E. BOWE SALES COMPANY, FOR FILING NARRATIVE FORM TRANSCRIPT IN CASES NOS. 4045 AND 4047 CONSOLIDATED FOR TRIAL AND APPEAL BY ORDER OF COURT, TWO CAUSES,

(Entered October 26, 1934 by Paul Jones, Judge.)

(Case No. 4047.)

This Order in Case No. 4047 is identical in wording, except as regards the name of the Defendant, with the similar Order in Case No. 4045 printed at page 49 of Vol. I.

ORDER APPROVING NARRATIVE FORM OF TESTIMONY.

(Entered February 26, 1935 by Paul Jones, Judge.)

[Case No. 4047.]

This Order in Case No. 4047 is identical in wording with the similar Order in Case No. 4045 printed at page 50 of Vol. I.

ACKNOWLEDGMENT OF SERVICE OF NARRATIVE FORM OF TESTIMONY.

(Filed February 26, 1935.)

[Case No. 4047.]

This Acknowledgment of Service in Case No. 4047 is identical in wording with a similar Acknowledgment of Service in Case No. 4045 printed at page 51, Vol. I.

NARRATIVE FORM OF TESTIMONY.

(Filed February 26, 1935.)

[Case No. 4047.]

The Narrative Form of Testimony in Case No. 4047 is identical in every respect with that in Case No. 4045 printed at pages 51 to 567, both inclusive, of Vol. I, and pages 569 to 1091, both inclusive, of Vol. II.

PLAINTIFFS' EXHIBITS.

The Exhibits of Plaintiffs called for by the Praecipe in Case No. 4047 and those withdrawn by the Order of Withdrawal in Case No. 4047 are identical with those included in or withdrawn from Case No. 4045; those included appear on pages 1321 to 1584, both inclusive, of Vol. III.

DEFENDANTS' EXHIBITS.

The Exhibits of Defendants called for by the Praecipe in Case No. 4047 and those withdrawn by the Order of Withdrawal in Case No. 4047 are identical with those included in or withdrawn from Case No. 4045; those included appear on pages 1585 to 1808, both inclusive, of Vol. III and pages 1809 to 2339, both inclusive, of Vol. IV.

The Order of the Withdrawal of Exhibits in Case No. 4047 is identical in wording with that in Case No. 4045, which appears on pages 1280 to 1281, both inclusive, of Vol. II.

REPORT OF WILLIAM B. WOODS, SPECIAL MASTER.

(Filed January 27, 1934.)

[Case No. 4047.]

The Report of the Special Master in Case No. 4047 is identical in wording with that in Case No. 4045 printed on pages 1092 to 1189, both inclusive, of Vol. II.

PLAINTIFFS' EXCEPTIONS TO THE REPORT OF THE SPECIAL MASTER.

(Filed February 26, 1934.)

[Case No. 4047.]

Plaintiffs' Exceptions to the Report of the Special Master in Case No. 4047 are identical in wording with those in Case No. 4045 printed on pages 1190 to 1228, both inclusive, of Vol. II.

MEMORANDUM ON EXCEPTIONS TO MASTER'S REPORT.

(Filed July 6, 1934.)

[Case No. 4047.]

The Memorandum on Exceptions to Master's Report in Case No. 4047 is identical in wording with that in Case No. 4045 printed on page 1229 of Vol. II.

FINAL DECREE.

(Filed July 27, 1934.)

[Case No. 4047.]

The Final Decree in Case No. 4047 is identical in wording with that in Case No. 4045 printed on page 1230 of Vol. II.

PETITION FOR APPEAL.

(Filed October 17, 1934.)

[Case No. 4047.]

The Petition for Appeal in Case No. 4047 is identical in wording with that in Case No. 4045 printed on page 1231 of Vol. II.

ORDER ALLOWING APPEAL.

(Entered October 17, 1934 by Paul Jones, Judge.)

[Case No. 4047.]

The Order Allowing Appeal in Case No. 4047 is identical in wording with that in Case No. 4045 printed on pages 1231 and 1232, of Vol. II.

ASSIGNMENT OF ERRORS.

(Filed October 17, 1934.)

[Case No. 4047.]

The Assignment of Errors in Case No. 4047 is identical in wording with that in Case No. 4045 printed on pages 1232 to 1250, both inclusive, of Vol. II.

CITATION.

(Filed October 20, 1934.)

[Case No. 4047.]

The Citation in Case No. 4047 is identical in wording, except as regards the name of the Appellee, with that in Case No. 4045 printed on page 1251 of Vol. II.

BOND ON APPEAL.

(Filed October 23, 1934.)

[Case No. 4047.]

The Bond on Appeal in Case No. 4047 is identical in wording, except as regards the name of the Appellee, with that in Case No. 4045 printed on pages 1253 and 1254, both inclusive, of Vol. II.

[illegible]

[Case No. 4047.]

The Orders in Case No. 4047 Extending Time for Lodging the Narrative, filing Praecipe and filing the Transcript of Record in the United States Circuit Court of Appeals are identical with those in Case No. 4045 printed on pages 1255 to 1265, both inclusive, of Vol. II.

These Orders of Extension are abbreviated as follows:

Time Extended From	For Filing Praecipe and/or Lodging Narrative To	For Filing Record In U. S. C. C. of A. To
Oct. 26/34	Nov. 24/34	Dec. 16/34
Nov. 22/34	Dec. 14/34	Dec. 26/34

This Order in Case No. 4047 is identical in wording with that in Case No. 4045 printed on page 1267 of Vol. II.

STIPULATION RE DIGEST OF EXHIBITS.

(Filed May 4, 1935.)

[Case No. 4047.]

This Stipulation in Case No. 4047 is identical in wording with that in Case No. 4045 printed on page 1267 of Vol. II.

ORDER GRANTING STIPULATION RE DIGEST OF EXHIBITS.

(Entered May 4, 1935 by Paul Jones, Judge.)

[Case No. 4047.]

This Order in Case No. 4047 is identical in wording with that in Case No. 4045 printed on page 1268 of Vol. II.

PRAECIPE.

(Filed May 6, 1935.)

[Case No. 4047.]

The Praecipe in Case No. 4047 is identical in wording with that in Case No. 4045 printed on pages 1269 to 1272, both inclusive, of Vol. II.

STIPULATION RE CERTIFICATION OF RECORD.

(Filed May 6, 1935.)

[Case No. 4047.]

The Stipulation Re Certification of Record in Case No. 4047 is identical in wording with that in Case No. 4045 printed on page 1273 of Vol. II.

DEFENDANTS' MOTION FOR LEAVE TO ADD TO THE RECORD IN THE ABOVE ENTITLED CAUSE DEFENDANTS' COUNTER PRAECIPE AND CERTAIN LETTERS.

(Filed May 14, 1935.)

[Case No. 4047.]

This Motion in Case No. 4047 is identical in wording with that in Case No. 4045 printed on pages 1273 to 1277, both inclusive, of Vol. II.

ORDER DENYING MOTION OF DEFENDANTS FOR LEAVE TO ADD TO RECORD DEFENDANTS' COUNTER PRAECIPE AND CERTAIN LETTERS.

(Entered May 15, 1935 by Paul Jones, Judge.)

[Case No. 4047.]

This Order in Case No. 4047 is identical in wording with that in Case No. 4045 printed on page 1277 of Vol. II.

PETITION TO SUPPLY LAST EIGHT PAGES MISSING FROM PLAINTIFFS' EXHIBIT 13 IN THE ABOVE CAUSE ON APPEAL.

(Filed June 18, 1935.)

[Case No. 4047.]

This Petition in Case No. 4047 is identical in wording with that in Case No. 4045 printed on page 1278 of Vol. II.

ORDER GRANTING LEAVE TO SUPPLY LAST EIGHT PAGES OF PLAINTIFFS' EXHIBIT NO. 13.

(Entered June 18, 1935 by Paul Jones, Judge.)

[Case No. 4047.]

This Order in Case No. 4047 is identical in wording with that in Case No. 4045 printed on page 1278 of Vol. II.

DEFENDANTS' COUNTER PRAECIPE.

(Filed June 27, 1935.)

[Case No. 4047.]

Defendants' Counter Praecipe in Case No. 4047 is identical in wording with that in Case No. 4045 printed on page 1279 of Vol. II.

ORDER SETTLING CONTENTS OF RECORD.

(Entered July 6, 1935 by Paul Jones, Judge.)

[Case No. 4047.]

Order Settling Contents of Record in Case No. 4047 is identical in wording with that in Case No. 4045 printed on page 1279 of Vol. II.

ORDER FOR WITHDRAWAL OF EXHIBITS.

(Entered September 4, 1935 by Paul Jones, Judge.)

[Case No. 4047.]

Order for Withdrawal of Exhibits in Case No. 4047 is identical in wording with that in Case No. 4045 printed on pages 1280 and 1281, both inclusive, of Vol. II.

UNITED STATES OF AMERICA,
NORTHERN DISTRICT OF OHIO,
EASTERN DIVISION, ss.

Record of the proceedings of the District Court of the United States within and for the Eastern Division of the Northern District of Ohio, in the causes and matters hereinafter stated, the same being finally disposed of at a regular term of said court begun and held at the City of Cleveland, in said district, on the first Tuesday in April, being the third day of said month, in the year of our Lord one thousand nine hundred and thirty-four and in the one hundred and fifty-eighth year of the Independence of the United States of America, to-wit, on Friday, the 27th day of July, A. D. 1934.

Honorable PAUL JONES,
United States District Judge.

THE CLEVELAND TRUST COMPANY,
CHRYSLER CORPORATION,
vs.
THE ABERDEEN MOTOR SUPPLY COMPANY.

No. 4046.
EQUITY.

Said action was commenced on the 17th day of October, A. D. 1931 and proceeded to final disposition at the term and day above written and during the progress thereof pleadings and papers were filed, process was issued and returned and orders of the court were made and entered in the order and on the dates hereinafter stated, to-wit:

ASSIGNMENT OF ERRORS.

(Filed April 17, 1936.)

[Case No. 4046.]

Now come plaintiffs, The Cleveland Trust Company and Chrysler Corporation, and present with their accompanying petition for appeal from the final decree entered herein, the following assignment of errors, which are hereinafter grouped with respect to subject matter:

GROUP A.

Assignment of errors relating to the validity of Gulick patent No. 1,815,733.

1. The Court erred in failing to find and hold the Gulick patent No. 1,815,733 good and valid in law, particularly as to claims 1, 11, 12, 13, 15, 18, 22, 27, 28, 29, 30, 33, 35, 36, 37, 38, 41, 42 and 43 thereof, and in failing to sustain plaintiffs' exceptions Nos. 2, 3 and 101.

Assignments 2 to 27, inclusive, same as in case 4045 (R. pp. 1233 to 1239).

GROUP B.

Assignment of errors relating to infringement of the Gulick patent in suit.

28. The Court erred in not holding that defendant has infringed the Gulick patent No. 1,815,733, particularly as to claims 1, 11, 12, 13, 15, 18, 22, 27, 28, 29, 30, 33, 35, 36, 37, 38, 41, 42 and 43 thereof, and in failing to sustain plaintiffs' exceptions Nos. 45 and 102.

29. The Court erred in approving and adopting the Special Master's finding of fact No. 38:

> "That defendants' pistons, Exs. 1, * * * and 8 do not embody the structure, function and mode of operation of the Gulick patent in suit."

and in not sustaining plaintiffs' exception (No. 44) to the aforesaid finding of fact No. 38.

30. The Court erred in approving and adopting the Special Master's finding of fact No. 43 and in not sustaining plaintiffs' exception (No. 54) to the following statements and conclusions in the aforesaid finding of fact No. 43:

(a) "* * * that the prior art requires restriction of the (Gulick) patent to the employment of webs which are of sufficient length and thinness to

permit flexing of those webs at the top of the skirt;

(b) that Exhibit 1 does not employ such characteristic webs;

(c) that Exhibit 8 does not employ such characteristic webs; * * * ."

Assignment 31 same as in case 4045 (R. p. 1240).

32. The Court erred in approving and adopting the Special Master's finding of fact No. 49,

"That such construction and arrangement (of the connectors from the head to the wrist pin boss in Exhibit 8) does not secure the mode of operation contemplated by the Gulick and Jardine patents."

and in not sustaining plaintiff's exception (No. 60) to the aforesaid finding of fact No. 49.

33. The Court erred in approving and adopting the Special Master's finding of fact No. 51:

"That defendants' pistons, Exs. 1, * * * 8 and 9 employ the essential structure, function and mode of operation of the prior art, more particularly the Franquist patent No. 1,153,902 and Exs. 8 and 9, also the Chenard & Walcker French patent No. 468,595."

and in not sustaining plaintiffs' exception (No. 62) to the aforesaid finding of fact No. 51.

34. The Court erred in approving and adopting the Special Master's conclusion of law No. 37:

"That defendant's pistons, Exs. 1, * * * and 8 do not infringe the Gulick patent in suit."

and in not sustaining plaintiffs' exception (No. 89) to the aforesaid finding of fact No. 49.

GROUP C.

Assignment of errors relating to validity of the Jardine patent No. 1,763,523.

Assignments 35 to 41, inclusive, same as 34 to 40, inclusive, in case 4045 (R. pp. 1241 to 1242).

GROUP D.

Assignment of errors relating to infringement of Jardine patent in suit.

Assignment 42 same as 41 in case 4045 (R. p. 1242).

43. The Court erred in approving and adopting the Special Master's finding of fact No. 39:

> "That defendants' pistons, Exhibits 1, * * * and 8 do not embody the structure, function and mode of operation of the Jardine patent in suit."

and in not sustaining plaintiffs' exception (No. 46) to the aforesaid finding of fact No. 39.

44. The Court erred in approving and adopting the Special Master's finding of fact No. 44 and in not sustaining plaintiffs' exception (No. 55) to the following statements and conclusions in finding of fact No. 44:

(a) "* * * that the prior art requires restriction of the patent (Jardine) to the employment of webs which are of sufficient lengths and thinness to permit flexing of these webs at the top of the skirt;

(b) that Ex. 1 does not employ such characteristic webs;

(c) that Ex. 8 does not employ such characteristic webs."

45. The Court erred in approving and adopting the Special Master's conclusion of law No. 38:

> "That defendants' pistons, Exs. 1, * * * and 8 do not infringe the Jardine patent in suit."

and in not sustaining plaintiffs' exception (No. 90) to the aforesaid conclusion of law No. 38.

Groups and Assignments 46 to 67, inclusive, same as 45 to 66, inclusive, in case 4045 (R. pp. 1243 to 1247).

GROUP H.

Assignment of errors relating to infringement of Mooers patent in suit.

Assignment 68 same as 67 in case 4045 (R. p. 1248).

69. The Court erred in approving and adopting the Special Master's finding of fact No. 41:

> "That defendants' pistons, Exs. 1, * * * 8 and 9 do not embody the structure, function and mode of operation of the Mooers patent in suit."

and in not sustaining plaintiffs' exception (No. 50) to the aforesaid finding of fact No. 41.

70. The Court erred in approving and adopting the Special Master's finding of fact No. 46 and in not sus-

taining plaintiffs' exception (No. 57) to the following statements and conclusions included in the Special Master's finding of fact No. 46:

(a) "* * * that the prior art requires such a restriction; (of the connectors from the head to the top of the skirt in the Mooers patent to narrow connectors of restricted cross sections);

(b) that in Exs. 1, * * * 8 and 9 the connectors are heavy and not of a structure as described in the Mooers patent * * *."

71. The Court erred in approving and adopting the Special Master's conclusion of law No. 40:

"That defendants' pistons, Exs. 1, * * * 8 and 9 do not infringe the Mooers patent in suit."

and in not sustaining plaintiffs' exception (No. 92) to the aforesaid conclusion of law No. 40.

Groups and Assignments 72 to 82, inclusive, same as 71 to 81, inclusive, in case 4045 (R. pp. 1248 to 1250).

SUPPLEMENTARY PRAECIPE.

(Filed April 17, 1936.)

[Case No. 4046.]

To the Clerk:—

Please prepare a supplementary transcript of record for the Circuit Court of Appeals, Sixth Circuit, in the above entitled cause, including the following:

1. Caption.

2. Assignment of Errors (per copy attached).

3. This Supplementary Praecipe.

4. Clerk's Certificate.

Please deliver these documents, above noted, to The Gates Legal Publishing Company.

RICHEY & WATTS.
Counsel for Plaintiffs.

The foregoing praecipe, together with the Assignment of Errors as attached hereto and setting forth assignments of errors differing from the assignments of errors printed in full in Equity No. 4045 has been agreed upon by counsel for the respective parties subject to the approval of the Court for the purpose of supplying omissions from the printed record. The Assignments of Errors were inadvertently not included in the consolidated record on appeal of causes in Equity Nos. 4045, 4046, 4047.

It is further stipulated that the supplemental transcript of record be consolidated in form to agree with the main Consolidated Transcript of record on appeal of causes in Equity Nos. 4045, 4046 and 4047, and entitled Cleveland Trust Company and Chrysler Corporation vs. The Schriber-Schroth Company, No. 4045; Cleveland Trust Company and Chrysler Corporation v. The Aberdeen Motor Supply Company, No. 4046; and Cleveland Trust Company and Chrysler Corporation v. The F. E. Rowe Sales Company, No. 4047.

RICHEY & WATTS,
Counsel for Plaintiffs.

April 7, 1936.

Without waiving other objections to record.

JOHN H. BRUNINGA,
Counsel for Defendant.

April 15, 1936.
Dated: April 17, 1936.

APPROVED:

JONES,
United States District Judge.

CAPTION.

UNITED STATES OF AMERICA,
NORTHERN DISTRICT OF OHIO,
EASTERN DIVISION, ss.

Record of the proceedings of the District Court of the United States within and for the Eastern Division of the Northern District of Ohio, in the causes and matters hereinafter stated, the same being finally disposed of at a regular term of said court begun and held at the City of Cleveland, in said district, on the first Tuesday in April, being the third day of said month, in the year of our Lord one thousand nine hundred and thirty-four and in the one hundred and fifty-eighth year of the Independence of the United States of America, to-wit, on Friday, the 27th day of July, A. D. 1934.

Honorable PAUL JONES,
United States District Judge.

THE CLEVELAND TRUST COMPANY,
CHRYSLER CORPORATION,
vs.
THE F. E. ROWE SALES COMPANY.
} No. 4047. Equity.

Said action was commenced on the 17th day of October, A. D. 1931 and proceeded to final disposition at the term and day above written and during the progress thereof pleadings and papers were filed, process was issued and returned and orders of the court were made and entered in the order and on the dates hereinafter stated, to-wit:

ASSIGNMENT OF ERRORS.

(Filed April 17, 1936.)

[Case No. 4047.]

Now come plaintiffs, The Cleveland Trust Company and Chrysler Corporation, and present with their accompanying petition for appeal from the final decree entered herein, the following assignment of errors, which are hereinafter grouped with respect to subject matter:

GROUP A.

Assignment of errors relating to the validity of Gulick patent No. 1,815,733.

1. The Court erred in failing to find and hold the Gulick patent No. 1,815,733 good and valid in law, particularly as to claims 1, 4, 11, 12, 13, 15, 18, 22, 27, 28, 29, 30, 33, 34, 35, 36, 37, 38, 41, 42 and 43 thereof, and in failing to sustain plaintiffs' exceptions Nos. 2, 3, and 101.

Assignments 2 to 27 inclusive, same as in case 4045. (R. pp. 1233 to 1259.)

GROUP B.

Assignment of errors relating to infringement of the Gulick patent in suit.

28. The Court erred in not holding that defendant has infringed the Gulick patent No. 1,815,733, particularly as to claims 1, 4, 11, 12, 13, 15, 18, 22, 27, 28, 29, 30, 33, 34, 35, 36, 37, 38, 41, 42 and 43 thereof, and in failing to sustain plaintiffs' exceptions Nos. 45 and 102.

29. The Court erred in approving and adopting the Special Master's finding of fact No. 38,

> "That defendants' pistons, Exs. 1, BBB, CCC, 3-J, 3-O and 8 do not embody the structure, function and mode of operation of the Gulick patent in suit."

and in not sustaining plaintiffs' exception (No. 44) to the aforesaid finding of fact No. 38.

30. The Court erred in approving and adopting the Special Master's finding of fact No. 43 and in not sustaining plaintiffs' exception (No. 54) to the following statements and conclusions in the aforesaid finding of fact No. 43:

(a) "* * * that the prior art requires restriction of the (Gulick) patent to the employment of webs

which are of sufficient length and thinness to permit flexing of those webs at the top of the skirt;

(b) that Exhibit 1 does not employ such characteristic webs;

(c) that Exhibit 8 does not employ such characteristic webs; and

(d) that Exhibits BBB and CCC * * * employ no webs at all."

Assignment 31 same as in case 4045 (R. p. 1240).

32. The Court erred in approving and adopting the Special Master's finding of fact No. 49,

"That such construction and arrangement (of the connectors from the head to the wrist pin boss in Exhibit 8) does not secure the mode of operation contemplated by the Gulick and Jardine patents."

and in not sustaining plaintiffs' exception (No. 60) to the aforesaid finding of fact No. 49.

33. The Court erred in approving and adopting the Special Master's finding of fact No. 50 and in not sustaining plaintiffs' exception (No. 61) to the following statements and conclusions in the said finding of fact No. 50:

"That Exs. BBB and CCC * * * do not employ any webs connecting the head with the skirt and, therefore, no webs of such flexibility as contemplated by the Gulick, Jardine and even Maynard patents, if the latter has such webs having such characteristics."

34. The Court erred in approving and adopting the Special Master's finding of fact No. 51,

"That defendants' pistons, Exs. 1, BBB, CCC, 3-J, 3-O, 8 and 9 employ the essential structure, function and mode of operation of the prior art, more particularly the Franquist patent No. 1,153,902 and Exs. 8 and 9, also the Chenard & Walcker French patent No. 463,595."

and in not sustaining plaintiffs' exception (No. 62) to the aforesaid finding of fact No. 51.

35. The Court erred in approving and adopting the Special Master's conclusion of law No. 37,

"* * * that defendants' pistons, Exs. 1, BBB, CCC, 3-J, 3-O and 8 do not infringe the Gulick patent in suit."

and in not sustaining plaintiffs' exception (No. 89) to the aforesaid conclusion of law.

GROUP C.

Assignment of errors relating to validity of the Jardine patent No. 1,763,523.

Assignments 36 to 42, inclusive, same as assignments 34 to 40, inclusive, of case 4045 (R. pp. 1241 to 1242).

GROUP D.

Assignment of errors relating to infringement of Jardine patent in suit.

Assignment 43 same as 41 in case 4045 (R. pp. 1242).

44. The Court erred in approving and adopting the Special Master's finding of fact No. 39,

"That defendants' pistons, Exhibits 1, BBB, CCC, and 8 do not embody the structure, function and mode of operation of the Jardine patent in suit."

and in not sustaining plaintiffs' exception (No. 46) to the aforesaid finding of fact No. 39.

45. The Court erred in approving and adopting the Special Master's finding of fact No. 44 and in not sustaining plaintiffs' exception (No. 55) to the following statements and conclusions in finding of fact No. 44:

(a) "* * * that the prior art requires restriction of the patent (Jardine) to the employment of webs which are of sufficient lengths and thinness to permit flexing of these webs at the top of the skirt;

(b) That Ex. 1 does not employ such characteristic webs;

(c) that Ex. 8 does not employ such characteristic webs;

(d) that Exs. BBB and CCC employ no webs at all."

46. The Court erred in approving and adopting the Special Master's conclusion of law No. 38,

"That defendants' pistons, Exs. 1, BBB, CCC and 8 do not infringe the Jardine patent in suit."

and in not sustaining plaintiffs' exception (No. 90) to the aforesaid conclusion of law No. 38.

GROUP E.

Assignment of errors relating to validity of the Maynard patent No. 1,655,968.

Assignments 47 to 56, inclusive, same as 45 to 54, inclusive, in case 4045 (R. pp. 1243 to 1245).

GROUP F.

Assignment of errors relating to infringement of Maynard patent in suit.

Assignment 57 same as 55 in case 4045 (R. p. 1245).

58. The Court erred in approving and adopting the Special Master's finding of fact No. 40,

"That defendants' pistons, Exs. 1, BBB, CCC do not embody the structure, function and mode of operation of the Maynard patent in suit."

and in not sustaining plaintiffs' exception (No. 48) to the aforesaid finding of fact No. 40.

59. The Court erred in approving and adopting the Special Master's finding of fact No. 45 and in not sustaining plaintiffs' exception (No. 56) to the following statements in the Special Master's finding of fact No. 45:

(a) "That the Maynard patent in suit describes a piston structure in which automatic compensation is not secured unless the groove E is cut into the webs F sufficiently and beyond the inside of the piston head flange to secure web extensions at the top of sufficient length and thinness to permit flexing of these web extensions at the top of the skirt;

(b) that Ex. 1 does not employ such characteristic webs; and

(c) that Exs. BBB and CCC employ no webs at all."

60. The Court erred in approving and adopting the Special Master's conclusion of law No. 39,

"That the defendants' pistons, Exs. 1, BBB, CCC do not infringe the Maynard patent in suit."

and in not sustaining plaintiffs' exception (No. 91) to the aforesaid conclusion of law No. 39.

GROUP G.

Assignment of errors relating to validity of Mooers patent No. 1,402,309.

Assignments 61 to 68, inclusive, same as 59 to 66, inclusive, in case 4045 (R. pp. 1246 to 1247).

GROUP H.

Assignment of errors relating to infringement of Mooers patent in suit.

Assignment 69 same as 67 of case 4045 (R. p. 1248).

70. The Court erred in approving and adopting the Special Master's finding of fact No. 41;

> "That defendants' pistons, Exs. 1, BBB, CCC, 3-O, 8 and 9 do not embody the structure, function and mode of operation of the Mooers patent in suit."

and in not sustaining plaintiffs' exception (No. 50) to the aforesaid finding of fact No. 41.

71. The Court erred in approving and adopting the Special Master's finding of fact No. 46 and in not sustaining plaintiffs' exception (No. 57) to the following statements and conclusions included in the Special Master's finding of fact No. 46:

(a) "* * * that the prior art requires such a restriction; (of the connectors from the head to the top of the skirt in the Mooers patent to narrow connectors of restricted cross sections);

(b) that in Exs. 1, BBB, CCC, 3-O, 8 and 9 the connectors are heavy and not of a structure as described in the Mooers patent * * *."

72. The Court erred in approving and adopting the Special Master's conclusion of law No. 40:

> "That defendants' pistons, Exs. 1, BBB, CCC, 3-O, 8 and 9 do not infringe the Mooers patent in suit."

and in not sustaining plaintiffs' exception (No. 92) to the aforesaid conclusion of law No. 40.

Remaining groups and Assignments 73 to 83, inclusive, same as 71 to 81 of case 4045 (R. pp. 1249 to 1250).

SUPPLEMENTARY PRAECIPE.

(Filed April 17, 1936.)

[Case No. 4047.]

To the Clerk:

Please prepare a supplementary transcript of record for the Circuit Court of Appeals, Sixth Circuit, in the above entitled cause, including the following:—

1. Caption.
2. Assignment of Errors (per copy attached).
3. This Supplementary Praecipe.
4. Clerk's Certificate.

Please deliver these documents, above noted, to The Gates Legal Publishing Company.

RICHEY & WATTS,
Counsel for Plaintiffs.

The foregoing praecipe, together with the Assignment of Errors as attached hereto and setting forth assignments of errors differing from the assignments of errors printed in full in Equity No. 4045 has been agreed upon by counsel for the respective parties subject to the approval of the Court for the purpose of supplying omissions from the printed record. The Assignments of Errors were inadvertently not included in the consolidated record on appeal of causes in Equity Nos. 4045, 4046, 4047.

It is further stipulated that the supplemental transcript of record be consolidated in form to agree with the main Consolidated Transcript of record on appeal of causes in Equity Nos. 4045, 4046 and 4047, and entitled Cleveland Trust Company and Chrysler Corporation v. The Schriber-Schroth Company, No. 4045; Cleveland Trust Company and Chrysler Corporation v. The Aberdeen Motor Supply Company, No. 4046; and Cleveland Trust Company and Chrysler Corporation v. The F. E. Rowe Sales Company, No. 4047.

RICHEY & WATTS,
Counsel for Plaintiffs.

April 7, 1936.

Without waiving other objections to record.

JOHN H. BRUNINGA,
Counsel for Defendant.

April 15, 1936.

Dated: April 17, 1936.

Approved: JONES,
United States District Judge.

CERTIFICATE OF CLERK.

NORTHERN DISTRICT OF OHIO, ss.:

I, F. J. Dengler, Clerk of the United States District Court within and for said district, do hereby certify that the foregoing printed pages contain a full, true and complete copy of the pleadings in Equity Nos. 4046 and 4047 in accordance with the Supplementary Praecipe for transcript of record filed herein, the originals of which papers remain in my custody as clerk of said court.

In Testimony Whereof, I have hereunto signed my name and affixed the seal of said court at Cleveland, in said district, this . . day of April, A. D. 1936 and in the One hundred and sixtieth year of the Independence of the United States of America.

F. J. DENGLER,
Clerk,

(Seal)

By C. B. WATKINS,
Chief Deputy.

[fol. 2379] PROCEEDINGS IN THE UNITED STATES CIRCUIT COURT OF APPEALS FOR THE SIXTH CIRCUIT

Causes Argued and Submitted May 4, 1937

Before Hicks, Simons and Allen, JJ.

These causes are argued by Newton D. Baker and F. O. Richey for Appellants and by J. H. Brunings and J. H. Sutherland for Appellees and are submitted to the court.

DECREE No. 7223—Filed October 8, 1937

Appeal from the District Court of the United States for the Northern District of Ohio

This cause came on to be heard on the transcript of the record from the District Court of the United States for the Northern District of Ohio, and was argued by counsel.

On Consideration Whereof, It is now here ordered, adjudged and decreed by this Court that the decree of the said District Court in this cause be and the same is hereby set aside and the cause remanded for the entry of a decree granting the usual relief of injunction and accounting in respect to the infringement of claims 1, 11, 12, 13, 15, 18, 30 and 33 of Gulick, and claims 1, 6 and 8 of Maynard patent, which claims are valid and infringed by the Sterling piston, exemplified by Exhibit 1, and dismissing the bill with respect to the alleged infringements of Jardine, Mooers and Schmiedeknecht without prejudice. Costs of the appeal will be borne by the defendant.

[fol. 2380] DECREE No. 7224—Filed October 8, 1937

Appeal from the District Court of the United States for the Northern District of Ohio

This cause came on to be heard on the transcript of the record from the District Court of the United States for the Northern District of Ohio, and was argued by counsel.

On Consideration Whereof, It is now here ordered, adjudged and decreed by this Court that the decree of the said

District Court in this cause be and the same is hereby set aside and the cause remanded for the entry of a decree granting the usual relief of injunction and accounting in respect to the infringement of claims 1, 11, 12, 13, 15, 18, 30 and 33 of Gulick, and claims 1, 6 and 8 of Maynard patent, which claims are valid and infringed by the Sterling piston, exemplified by Exhibit 1, and dismissing the bill with respect to the alleged infringements of Jardine, Mooers and Schmiedeknecht without prejudice. Costs of the appeal will be borne by the defendant.

Decree No. 7225—Filed October 8, 1937

Appeal from the District Court of the United States for the Northern District of Ohio

This cause came on to be heard on the transcript of the record from the District Court of the United States for the Northern District of Ohio, and was argued by counsel.

On Consideration Whereof, It is now here ordered, adjudged and decreed by this Court that the decree of the said District Court in this cause be and the same is hereby set aside and the cause remanded for the entry of a decree granting the usual relief of injunction and accounting in respect to the infringement of claims 1, 11, 12, 13, 15, 18, 30 and 33 of Gulick, and claims 1, 6 and 8 of Maynard patent, which claims are valid and infringed by the Sterling piston, exemplified by Exhibit 1, and dismissing the bill with respect to the alleged infringements of Jardine, Mooers and Schmiedeknecht without prejudice. Costs of the appeal will be borne by the defendant.

OPINION—Filed October 8, 1937

[fol. 2381] [Stamp:] Filed Oct. 8, 1937. John W. Menzies, Clerk

Nos. 7223-4-5

UNITED STATES CIRCUIT COURT OF APPEALS, SIXTH CIRCUIT

No. 7223

THE CLEVELAND TRUST COMPANY, CHRYSLER CORPORATION, Appellants,

v.

THE SCHREIBER-SCHROTH COMPANY, Appellee

No. 7224

THE CLEVELAND TRUST COMPANY, CHRYSLER CORPORATION, Appellants,

v.

THE ABERDEEN MOTOR SUPPLY COMPANY, Appellee

No. 7225

THE CLEVELAND TRUST COMPANY, CHRYSLER CORPORATION, Appellants,

v.

THE F. E. ROWE SALES COMPANY, Appellee

Appeals from the District Court of the United States for the Northern District of Ohio, Eastern Division

Decided October 8, 1937

Before Hicks, Simons and Allen, Circuit Judges

SIMONS, Circuit Judge:

In a study of the patents and prior art involved in Wahkesha Motor Co. v. Willys Overland, Inc., 77 Fed. (2d) 906, and The Perfect Circle Co. v. Hastings Mfg. Co., 88 Fed. (2d) 813, we learned something of the principles

of operation and the mechanics employed in the conventional four-cycle internal combustion engine of the modern [fol. 2382] motor car. It will therefore be unnecessary here to repeat what was there said in reference thereto. In the first we considered the explosion chamber, and in the second the piston ring. In the present infringement suit we deal with the piston.

In the rapid reciprocation of a piston within the cylinder, as in the references described, the desirability of maintaining a close fit was obvious and had long been recognized. This was necessary to avoid waste of power through gases being permitted to pass below the piston from the explosion chamber, a condition known as "blow-by," to prevent lubricating oil passing above the piston into the explosion chamber, a condition known as "pumping oil," and to prevent the slapping of the piston in the cylinder, making for a noisy engine and tending to break its parts. On the other hand a too close fit would, because of the expansion of the piston by the great heat generated in the cylinder, cause it to bind or "seize" therein, thus stalling the engine or perhaps even wrecking it.

Cylinders were and generally still are cast of iron, and prior to the period we are here considering pistons were likewise so cast. The disadvantages in this organization were early recognized. Since iron is a poor conductor of heat, the particles of carbon that would form on the cylinder head would become overheated and cause premature explosion in the combustion chamber. Iron is also heavy, and with the great acceleration of piston reciprocation, due to the ever increasing demand for speed, the industry began to cast about for expedients to lighten the pistons. There were numerous efforts and failures in this respect with the conventional iron trunk piston. Lighter metals were considered, but since strength and durability to withstand the great force of rapid explosions upon the piston head and the powerful thrust imparted to its bearing faces by the power stroke of the piston as it imparted energy to the crank shaft were prerequisites, the art was limited to metal that was both strong and durable. It turned, therefore, quite naturally and inevitably, to aluminum. A new and for a long time seemingly insuperable problem at once confronted the automotive engineers, due to the fact that the coefficient of expansion differs greatly in the two metals,

and that under heat aluminum will expand much more rapidly than iron. Since the desirable clearance is minute, approximating one one-thousandth of an inch, it was at once clear that an aluminum piston, installed when cold with required clearance in an iron cylinder, would when heated by operation seize, and that a piston with clearance [fol. 2383] sufficient to avoid seizing would waste power, pump oil, cause undesirable noises, and lack durability.

Ingenious, numerous and varied were the expedients resorted to in an effort to achieve the clearly recognized advantages of aluminum pistons, while at the same time avoiding troublesome results, and equally numerous were the failures, by reason of which a prejudice had developed in the industry against them, and it was said they had had a "black eye."

The Cleveland Trust Company, appellant, is the repository of numerous patent rights assigned to it by inventors and by piston and automobile manufacturers, and it is its contention that the aluminum piston problem was completely solved by some of its assignors, and that a structure embodying the disclosures of the patent to Jardine, No. 1,763,523, granted June 10, 1930, but in a more specific and improved form described in Maynard No. 1,655,968, granted January 10, 1928, but on an application later than Jardine's, had gone into wide commercial use, being accepted by the industry, with the exception of some divisions of the General Motors Corporation, had sold in the tens of millions, and is now infringed by pistons of the appellees. The Jardine and Maynard patents belong to the Trust Company. Conceiving, however, that a Gulick application, which was being prosecuted by the Packard Motor Car Company, would, with its broader claims, dominate both Jardine and Maynard, the Trust Company purchased it and prosecuted it to successful conclusion after numerous interferences, the patent issuing as Gulick No. 1,815,733, on July 21, 1931. The Trust Company also owns Schmiedeknecht patent No. 1,256,265, granted February 12, 1918, and Meeers, No. 1,402,309, granted January 3, 1922, both for pistons, and seven accused devices are all alleged to infringe some of the claims of some or all of the five patents.

The appellees are three Cleveland dealers who have sold alleged infringing pistons manufactured by the Sterling Products Corporation of St. Louis, Missouri. While the

manufacturer was named in the original bills of complai
they were dismissed as to it, it being understood, howeve
that Sterling Products Corporation was conducting t
defense of the three suits. By stipulation they were co
solidated below, and all are before this court upon t
same record. At the outset only two alleged infringi
devices were involved, one a Sterling piston known as E
hibit 1, and the other a Ray-Day piston known as Exhibit
During the progress of the trial five additional structur
were introduced as infringements. While there is no fin
[fol. 2384] ing to that effect, it seems to have been assume
that all of the alleged infringing devices were sold by ea
of the three defendants. The consolidated cause was r
ferred to a master, whose very detailed findings of fa
and conclusions of law were affirmed by the District Judg
without discussion and decrees entered dismissing the bill
While the Chrysler Corporation appears as party plainti
below and as co-appellant here, it has never entered it
appearance and its presence in the case as a nominal plain
tiff is due to the fact that it owns a half interest in th
Maynard patent and was therefore joined as party plain
tiff. An issue raised below as to the propriety of Chrys
ler being made a nominal party is abandoned here, sinc
the defendants have not appealed.

The controversy is involved and has been bitterly fough
The record is voluminous, the exhibits, physical and other
wise, numerous, the patent office history discloses persisten
challenge, and of eighty-odd claims fifty-two are said t
be infringed. While we have given careful consideratio
to the briefs and record, it is manifest that the necessities
of the case and the desirable limit of an opinion will per
mit us to discuss only the more salient features of the con
troversy, with perhaps summary disposition of its lesse
issues, for the challenge to the validity of the patents and
to the fact of their infringement includes most if not al
of the defenses known to the patent law.

We deal first with the patent to Gulick, in agreemen
with the contention that if valid it is basic. Gulick has
been connected with various motor car and motor cycle
manufacturing companies in a number of capacities, in
cluding that of factory manager. He was also an inven
tor, having prosecuted some fifty applications in the paten
office. As early as 1908 he had a conception of a split and

flexible piston, but did nothing more for several years than to make sketches. In 1911 he made some experiments with modified standard iron pistons, giving them block tests in a motor cycle and in an Excelsior motor. The motor was later put into a Renault car and given a substantial road test. These early pistons were scrapped. In 1914 he made his first test with aluminum pistons in an Amplex car, which he used personally for some 4500 to 5300 miles. In 1917, along with other patents and patent applications, Gulick assigned his inchoate rights to the Packard Motor Car Company, and the application for the piston patent was filed by it on November 30th of that year. There followed long discussions with the examiners, administrative reviews, bitterly contested interferences, and appeals to [fol. 2385] the Court of Appeals of the District of Columbia (Long v. Gulick, 17 Fed. [2d] 686), and to the Court of Customs and Patent Appeals (Hartog v. Long, 47 Fed. [2d] 369). There had also been amendments to the original application at the instance of the inventor's assignee. It was not until July 21, 1931, that the Gulick patent issued with its forty-three claims.

The Gulick patent is for a combination of elements, many, if not indeed all of which, are to be found in the prior art. Nowhere, however, is found his precise organization, and the question at once presents itself as to whether there was exercise of the inventive faculty in the concept of their combination, for that a new result was achieved and a new mode of operation of an aluminum piston in its iron cylinder brought about is not successfully challenged on this record. Gulick separated the smaller ring carrying head of the piston from the somewhat larger skirt by a groove or air gap. This tends to prevent the passage of heat from the head directly to the skirt and permits the bearing faces of the skirt to yield to pressure independently of the head. The wrist pin bosses are pulled inwardly from the skirt periphery, and instead of being supported by the skirt are carried from the piston head by depending flanges, thus providing a vertically rigid support for the bosses with freedom of lateral motion in a direction at right angles to the load thrusts on the piston. The surface of the skirt where the bosses are connected to the head in conventional pistons was cut away or relieved, so that the bosses are not directly constrained by the cylinder

wall. They are held in place by webs extending in the general direction of load thrusts on the piston. One bearing face of the skirt is slotted vertically from the bottom edge up to and connecting with the air gap. That Spillman and Mooers patent 1,092,870, and Franquist patent 1,153,902 showed air gaps between piston head and skirt, or that splitting the piston skirt vertically or combining the vertical and longitudinal splits into the so-called T-slot were old practices, is not conclusive on the question of invention.

Since the cylinder head is the first to heat, and becomes hotter than the skirt it had always been machined with greater clearance, the control of oil and gas flow being taken care of in part at least by the piston rings, which function as a packing. See Perfect Circle Co. v. Hastings, supra. The problem of maintaining a close fit between an aluminum piston and an iron cylinder without seizing under heat expansion is a problem involving the skirt, which guides the piston and carries the bearings for the wrist pin, [fol. 2386] upon which is exerted the thrusts of the connecting rod through the cycle of reciprocation. To decelerate the flow of heat from piston head to skirt by an air gap was perhaps an obvious expedient in the art. To slit the skirt vertically so that pressure of the cylinder wall would compensate for thermal expansion was perhaps not beyond expected skill in the art. Minute relief of the cylinder periphery in the region of the bosses was shown in Franquist. But to combine insulation of head from skirt, retraction of the bosses from the skirt periphery, connection of such bosses to the skirt with webs laterally flexible and yet so carried from the head as to support the load upon the wrist pin with sufficient strength and rigidity, and to utilize the mechanical force of the cylinder wall upon the skirt and the thermal expansion of the bosses so as to compensate evenly and fully for head expansion and to secure a balanced flexibility of the skirt with no bending concentration at any point therein, discloses, we think, a meritorious concept beyond the reach of those skilled in the art. Franquist, of course, does disclose the broad concept of a flexible skirt. But Franquist gives no hint at all of the Gulick invention. His flexibility was obtained by grooves on the accordion principle, which while they interrupted the outer periphery of the piston skirt, did not destroy its inner unity. Some flexibility no doubt it had, but certainly

not in the sense that Gulick disclosed it, and it is doubtful that the Franquist piston could have met the severe tests required by the industry. And of commercial history it has none upon this record.

Probably the most difficult task that confronts a patent court lies in determining whether there is invention in a combination whereof many or all cooperating elements are old, and when concepts, however remarkable when disclosed, have in a rapidly developing art already become commonplace, not only to the expert but to the unskilled. It is not easy after the lapse of years to evaluate advances with the "eye and the understanding" of those in the field when they were made. Inventive concept is an abstraction impossible to define, and so courts have sought for simple rules by which its presence may be detected. These have proved helpful, even though never absolute. Long recognition of an existing problem in any art, and the advantages to accrue to an industry from its solution, coupled with repeated failures to find solution, has ever been considered as highly persuasive of invention when success is finally attained. Sometimes achievement is revolutionary, an abandonment of all previous approaches, and the chart-[fol. 2387] ing of a new way to the goal. More often the inventor begins where others leave off, and perceives the vital forward step to which predecessors had been blind. Even then success may not be fully recognised until the world gives acclaim.

The present record is conclusive of the long unsuccessful search for a light weight piston sufficiently durable to obviate the well-known disadvantages of the iron trunk piston in high speed engines. There was much research and experimentation by those most highly skilled, including the engineers of the Aluminum Company, Colonel Vincent of the Packard Motor Car Company, one of the designers of the Liberty engine, and the engineering staff of the Franklin Automobile Company, under the direction of the defendants' expert Stellmann, its Chief Engineer. Limited success may here and there have been attained, but the problem in its full sweep was not solved until the Gulick concept, carried forward to some extent by Maynard, with possibly some instruction from Jardine, reached commercial embodiment. Then and then only did the industry by acceptance of the Aluminum Company's piston answering the Maynard draw-

ing and specification, recognize the complete solution of the problem, and the many millions that have since been sold and used have set the seal of commercial approval upon such solution. It is idle to say in an imperfect world that invention should be denied because no piston, not even Maynard, performs perfectly.

It is, of course, axiomatic that commercial success is not of itself conclusive upon the question of novelty or invention, and where such success is fairly attributable to other causes, such as the reputation of the manufacturer, his extensive advertising and superior salesmanship, it will be wanting in persuasiveness. But where no alternative inferences are to be drawn, commercial success is highly indicative of invention. This is so in the usual case where the test of success is acceptance by the public. But it must be here noted if not elsewhere observed, that where success follows acceptance by experts rather than by those unskilled, it is of far greater tribute to the ingenuity of the inventor. It is clearly demonstrated upon this record, if indeed it is not within the field of general knowledge, that the automotive industry in acceptance of new devices upon which success of highly complicated and delicate machinery in the hands of inexpert users must depend, exercises the greatest caution, and things new, whatever their theoretical virtue, will not be considered until they have been subjected to the most rigorous practical tests for efficiency and durability. [fol. 2388] This must be so when failure of one year's product may bring tremendous losses or complete disaster.

So also with respect to the presumption that attaches to the validity of a grant by the Patent Office. Where, as in this case, substantially all pertinent prior art has been cited against the patent, where in hard fought interferences novelty and invention have been challenged, and where priority of conception has been finally adjudicated only upon repeated review in both administrative and judicial forums, the patent should not be stricken down except upon very clear and convincing proof of invalidity. The weight to be given this presumption has been so recently and so thoroughly discussed, and the rule stated in all the varying formulae by which courts have announced and affirmed it, in Radio Corporation v. Radio Laboratories, 293 U. S. 1, that it is unnecessary here to repeat or to cite additional cases.

In what we have said thus far it is perhaps clear that in respect to novelty and invention over recorded prior art we have concluded the Gulick patent to be valid. But this is not the whole controversy with respect to it. It is the contention of the defendant that the Gulick patent is invalid because abandoned by him prior to his application, and because it had been in public use in this country for more than two years before such application within the purview of R. S. §§4886, 4920. The Master so held. His findings were based on the fact that Gulick's 1911 and 1914 pistons had been scrapped, and on inference that Gulick's expressed satisfaction with his 1914 experimentation was conclusive of the completion of his invention in that year. That there had been no formal abandonment or disclaimer is clear. The Master's findings are based upon constructive abandonment deduced from the above circumstances and delay in applying for a patent.

Questions relevant to actual or to constructive abandonment of inventions are questions of fact, Walker, 6th Ed., §152; Kendall v. Winsor, 21 How. 330, and much weight must therefore be given to the findings of the Master, who saw and heard the witnesses. Consideration should also be given to the rule that concurrent findings of Master and Judge should not be set aside except for clear error, although this may prove to be an unsafe guide to just decision where exceptions to a Master's report are unilluminated by oral argument and a decree entered without elucidation of the reasons upon which it is based. The law, however, in reference to abandonment, requires that every reasonable doubt relevant to any such question should be resolved in favor of [fol. 2389] the patent, for it does not favor forfeiture. Walker, §152 and cases there cited. It was said by this court, Gear Grinding Machine Co. v. Studebaker Corp., 270 Fed. 934, 936: "Abandonment depends upon intent, actual or imputed. The actual intent did not exist, and the circumstances do not require that the intent be by law imputed as against the truth." That Gulick did not intend to abandon the subject matter of his invention seems to us clear. From the beginning of his experimentation in 1911 he made drawings from time to time, tests with slotted iron pistons and later with slotted aluminum pistons, and was at the same time not only busy in the earning of a livelihood but with plans for the purchase from a receiver of the prop-

erty of the Amplex Motor Car Company. The scrapping of his experimental pistons was without his knowledge or consent, and the fact that he replaced the experimental pistons of the Result car with standard pistons before its sale negatives any inference that the experimental pistons were intended to be abandoned. Distinction must also be made between abandonment of the subject matter of a patent and abandonment of crude experimental devices. While Gulick variously expressed satisfaction with the performance of his experimental pistons, it is clear upon review of his entire evidence that what he had then in mind was that they performed satisfactorily in reference to clearance. They had not demonstrated their strength and durability, or that they were properly designed or machined for commercial use.

The Master was largely influenced by the fact that Gulick's clarification of his testimony followed a recess, and gave little credence to it. We have reviewed it carefully. That Gulick's experiments were not completed to the end that a practical piston had been fully designed and tested seems clear. He is in some respects corroborated and in no wise impeached. Mere suspicion as to his good faith is not such clear and convincing proof of abandonment as will satisfy every reasonable doubt and sustain the heavy burden which rests upon those challenging the validity of his patent. The Master did not apply to the evidence on the issue of abandonment that standard of proof required to establish it and so the question is one of law, and the finding must be rejected.

There was no public use of the Gulick invention more than two years prior to the application so as to invalidate the patent. So long as use by the inventor can fairly be considered experimental and collateral to the development of the invention in its complete form, the bar of the statute does not begin to run. Beo Motor Car Co. v. Gear Grinding Co., 42 Fed. (2d) 965 (C. C. A. 6). The emphasis that is laid [fol. 2390] upon Gulick's use of a car with experimental pistons for business and pleasure for a considerable period does not impress us. Road tests of many thousands of miles are considered necessary to determine the efficiency of an engine and its parts. That such transportation is not wanted does not of itself constitute a public use. As we said in the second Gear Grinding case: "We see no principle in the precedents or in the policy of the statute which would re-

quire a valuable invention to be lost by permitting the bar to begin to run while the invention * * * is being gradually improved and developed up to the point of ascertaining whether it has real utility. Nor can it rightly be said that a public use of a developing and incomplete invention—incomplete as finally claimed—can nevertheless operate as a public use bar because adding the final element of perfection did not involve invention as compared with the earlier form to which it was added."

We are not convinced that the Gulick application was broadened to include new matter after intervening rights had arisen. This issue was adjudicated in the Court of Appeals of the District of Columbia, 17 Fed. (2d) 365, and the Court of Customs and Patent Appeals, 47 Fed. (2d) 366, 367. With the conclusions there reached we agree. As to the Monckmeir and Schoengarth prior uses, it is sufficient to say without analysis of the voluminous evidence, that they rest mainly upon the uncertain memory of witnesses testifying long after the event, and this does not rise to the dignity of proof requisite to establish prior use. Barbed Wire Patent Case, 143 U. S. 275; Eibel Process Case, 261 U. S. 45.

Jardine, upon an application filed March 11, 1920, claimed an invention of which the chief object was construction of a light alloy piston which would operate satisfactorily at all temperatures and lend itself to economic methods of manufacture. He cut away all the skirt portions at the webs, extending the latter to nearly the length of the skirt parts or slippers. Horizontal slots partially insulated the slippers from the head and these were split vertically to render them yieldable to contact with the cylinder wall. The head was integrally connected to the skirt only in the region above the bosses. His thought was that since heat expansion tends to increase the diameter of the piston in a direction parallel with the wrist pin bosses, when the skirt around the bosses is removed, the central part of the web is free to move while its ends are restrained and resisted by the skirt, faces in contact with the cylinder wall. There is insistent challenge and an insistent defense of the validity of Jardine. [fol. 2391] On the one hand it is urged that Jardine is but the slipper structure of Ricardo patent No. 1,294,833, and that it involved no invention to merely slit vertically its skirt parts as disclosed by Gulick and others. The response

is that Jardine discloses a combination of inter-related operating parts that goes far beyond Ricardo, is economical to construct and carries the Gulick concept an important step forward. Jardine indicates the forces, thermal and mechanical, which bear upon the flexible web to compensate for heat expansion of the cylinder head, pointing to the web as being in effect a cantilever structure, weakest at its supports. Jardine came to the attention of the Aluminum Company and the Maxwell at a time when Ricardo and other English engineers were trying to modify the Ricardo piston to meet the piston problem. It was thought to give great promise. Tests had been made and commercial manufacture planned when the Maynard piston was presented to them. It appeared so much better that the construction illustrated and described by him was adopted. Since it is the Maynard specific form embodying the basic concept of Gulick that made commercial piston history, since Jardine was without substantial commercial recognition and none of the accused devices are slipper pistons, since whatever Jardine contributed to the art, if anything, is said to be incorporated in Maynard and since the really important infringement is said to be the copying by the defendants of the commercial embodiment of Maynard, we feel under no necessity at this time of ruling upon the validity of the Jardine patent or the fact of its infringement.

Maynard upon a patent application filed January 3, 1931, embodies the Gulick combination of skirt insulation, skirt flexibility by means of vertical slotting cooperating with longitudinal slotting, and flexible webs in the region of the wrist pine bosses. He also follows Jardine's simplified design to permit economical manufacture and Jardine's boss relief. The Maynard piston, however, is not a slipper piston. While Jardine carried the webs nearly to the bottom of the skirt and omitted all of the skirt on the web faces, Maynard provided webs about two-thirds of the length of the skirt and continued the latter circumferentially below the webs except for a single vertical slot throughout one bearing face of the skirt. This structure increased the effect of heat on retarding the expansion of the piston so as to permit of a narrowed web. The upper part of the skirt, which reaches higher temperature, is provided with greater compensation against heat expansion [fol. 2392] by having its periphery interrupted by relief

about the bosses. The lower part of the skirt requires no interruption of its periphery other than the vertical slot because it receives less heat. This results in a better bearing surface and means additional to the piston rings for closing the passage between the piston and the cylinder wall. It is clear that Maynard, while not departing from the teaching of Gulick in basic combination of elements, discloses a piston lighter and more economical of manufacture than Gulick and one more rugged and durable than Jardine. That the Maynard piston had a very great effect upon the industry and substantially advanced the art, there can be no doubt upon this record. In the precise form disclosed by Maynard and depicted in his drawings, many thousands were made and successfully used. In a somewhat modified form its production and use has run into very many millions.

Little is claimed for Moores and Schmiedeknecht, and while some of the claims of each may possibly read on some of the accused structures, they have apparently no commercial history and have not substantially advanced the art. We do not pass upon them, and apprehend that the real controversy here is in respect to validity and infringement of Gulick and Maynard.

Of the devices charged to infringe, the one of prime importance to the plaintiff is undoubtedly the Sterling piston, exemplified by Exhibit 1. The defendants seek to avoid infringement by this structure, which with slight modification, follows the drawings and description of the Maynard patent, and without change, the commercial structure of the plaintiff's licensee, by the contention that its webs are rigid at the top and thus it is distinguished from Maynard, compensation for rigidity being achieved by reducing the thrust faces of the piston skirt at an angle to the vertical sides of the web, giving to the relief in the region of the bosses the so-called "keystone" configuration. But there are no limitations in the claims in suit as to the region of flexibility in the webs, and if the keystone relief provides greater flexibility at the union of the webs with the skirt, it is but a difference in degree, and not one of mode of operation or result and will not avoid infringement. In comparing commercial embodiments of invention with the drawings of patents it is not unusual to find that without departing from the teachings of the inventor improved

operation may result from some modification of the disclosure. This court has indicated, Gordon Form Lathe Co. v. Walcott Machine Co., 32 Fed. (2d) 55, 61, that superiority of operation, even when brought about by a valuable [fol. 2393] improvement which perhaps was patentable as such, will not of necessity negative infringement, citing Schiedel Toy, etc., Co. v. Clark, 217 Fed. 760, 771, Toledo Machine & Tool Co. v. E. W. Bliss Co., 287 Fed. 443, 447. The Gordon and Redlin patent there considered was in a true sense a pioneer patent and entitled to broad equivalents, but this does not mean that meritorious inventions which substantially advance the art are entitled to no reasonable range of equivalency. As was said in Eibel Process case, supra, at 63: "Eibel made a very useful discovery which has substantially advanced the art. His was not a pioneer patent creating a new art; but a patent which is only an improvement on an old machine may be very meritorious and entitled to liberal treatment. Indeed, when one notes the crude working of machines of famous pioneer inventions and discoveries, and compares them with the modern machines and processes exemplifying the principle of the pioneer discovery, one hesitates in the division of credit between the original inventor and the improver; and certainly finds no reason to withhold from the really meritorious improver, the application of the rule 'Ut res magis valeat quam pereat' which has been sustained in so many cases in this court." A careful consideration of the patents to Gulick and Maynard, an analysis of the claims of each in suit, and a review of the evidence as to principles and modes of operation, lead us inevitably to the conclusion that the Sterling piston (Exhibit 1) infringes the claims in suit of both, and that such minor differences as appear in the commercial embodiment of Maynard, with which Exhibit 1 is identical, do not fall without the reasonable range of equivalents to which the inventors' contribution to the advancement of the art entitle them.

In the remaining accused devices we find no infringement. True, there is similarity. Here and there are identical elements, singly and in combination, but the complete combination upon the conception of which we found Gulick and Maynard to denote invention, does not in any others appear, and so it must be said here as in Gear Grinding Machine Co. v. Studebaker Corporation, supra, in reference

to such situation: "It is the patentee's necessary dependence upon the co-operation of all the elements in one machine in order to make the claims valid that also makes this achievement possible."

We find claims 1, 11, 12, 13, 15, 18, 30, 33 of Gulick and Maynard patent in respect to all of the claims sued upon valid. We find such claims to be infringed by the Sterling piston exemplified by Exhibit 1. The decrees below are set aside and the causes remanded for the entry of decrees [fol. 2394] granting the usual relief of injunction and accounting in respect to such infringement as has been found and dismissing the bills with respect to the alleged infringements of Jardine, Moores and Schmiedeknecht, without prejudice. Costs of appeal will be borne by the defendants.

[fol. 2395] UNITED STATES CIRCUIT COURT OF APPEALS FOR THE SIXTH CIRCUIT

I, J. W. Menzies, Clerk of the United States Circuit Court of Appeals for the Sixth Circuit, do hereby certify that the foregoing is a true and correct copy of record and proceedings in the cases of The Cleveland Trust Company and Chrysler Corporation vs. The Schriber-Schroth Company, The Aberdeen Motor Supply Company, The F. E. Rowe Sales Company, No. 7223-4-5, as the same remains upon the files and records of said United States Circuit Court of Appeals for the Sixth Circuit, and of the whole thereof.

In testimony whereof, I have hereunto subscribed my name and affixed the seal of said Court at the City of Cincinnati, Ohio, this 30th day of December, A. D. 1937.

J. W. Menzies, Clerk of the United States Circuit Court of Appeals for the Sixth Circuit. (Seal.)

PETITION FOR WRIT OF CERTIORARI TO THE UNITED STATES CIRCUIT COURT OF APPEALS FOR THE SIXTH CIRCUIT.

To the Honorable the Chief Justice of the United States, and the Associate Justices of the Supreme Court of the United States:

Your petitioners, The Schriber-Schroth Company, The Aberdeen Motor Supply Company, and The F. E. Rowe

Sales Company, respectfully pray for writs of certiorari to the Circuit Court of Appeals for the Sixth Circuit to review the judgments of that court entered on October 8, 1937.

Summary and Short Statement.

Petitioners were defendants in the District Court, where they prevailed. The Circuit Court of Appeals for the Sixth Circuit reversed the District Court, in part.

Respondent, The Cleveland Trust Company,* is a banking corporation holding title (under a Trust Agreement, R. p. 1345) to a pool of eighty odd patents (R. p. 2241). The patents included in the pool were assigned to Respondent by the Packard Motor Company (R. p. 1321), Aluminum Company of America (R. p. 1322), and others. All of the patents in the pool relate to pistons for internal combustion engines, of the type employed in automobiles.

Licenses under the pool of patents are held solely by The Aluminum Company of America (R. p. 1382), Bohn Aluminum & Brass Corporation (R. p. 1415), and Aluminum Industries, Inc. All have agreed (R. p. 182) to pool all patents relating to pistons per se, now owned or hereafter acquired by them. All own shares of beneficial interest in the pool (R. p. 271), The Aluminum Company of America and the Bohn Company in their own names, and the Aluminum Industries through its officer and principal, H. J. Hater. All pay royalties to the pool on all aluminum pistons made by them and the proceeds are thereafter paid back to the beneficiaries.

Respondent brought three separate suits against the respective Petitioners (three Cleveland dealers in pistons made by Sterling Products Corporation of St. Louis, Missouri), alleging infringement of five different patents. The three cases all involve the same issues (including the same

---

*Herein referred to as "Respondent", Chrysler Corporation having been but a nominal and unwilling party plaintiff below.

accused device) and for convenience were consolidated below, likewise here. Respondent caused these cases to be referred to a Special Master for trial upon the merits. The Master heard the testimony of witnesses, observed tests and considered the evidence which was introduced by the parties. He found (R. p. 1106-9) all five patents invalid, and further found that the patents, if valid, were not infringed by any of the several accused devices. Respondent filed many exceptions to the report of the Special Master, but the District Court (R. p. 1229) overruled all of the exceptions and entered a decree (R. p. 1230) adopting the Master's Findings of Fact and Conclusions of Law as its own.

Respondent appealed to the Court of Appeals for the Sixth Circuit, with the result that two of the patents [Gulick No. 1,815,733 (R. p. 1293) and Maynard No. 1,655,968 (R. p. 1299)] were held to be valid (R. p. 2395), and to have been infringed by one accused device (Exhibit 1). The Court of Appeals apparently regarded the patents as pertaining particularly to pistons made of *aluminum*, although neither the Gulick nor the Maynard patent makes any reference whatever to aluminum. The Court of Appeals also regarded the patents as pertaining to pistons of the "flexible web" type, although there was no reference to this essential feature in the application for either of them, *as filed*.

The application for Gulick patent was filed in November, 1917, but the patent did not issue until 1931. *As filed* in 1917, it described the piston as "extremely rigid." (R. p. 1839.) Between 1917 and 1922 it became evident* that pistons of the "flexible web" type would become popular. In 1922 there

---

*This was largely attributable to the efforts of one Long, who, as found by the Master (R. p. 1103) had produced such a piston as early as March, 1916, had it on the market from 1917 to 1926 and had it adopted by the Franklin Automobile Company in 1920. The Long piston was described by an engineer of Packard Motor Company in a publication in January, 1920, and was being advertised to the trade in 1921. In 1926, after Respondent had sued him, Long discontinued his piston business.

were pending in the Patent Office several applications disclosing the "flexible web" type of piston. An interference was declared between a Hartog application and a Pomeroy application, the latter owned by Aluminum Company of America. This terminated adversely to Aluminum Company of America on August 10, 1922 (R. p. 2279). Immediately thereafter steps were taken by Packard Motor Company and Respondent, probably with the aid and assistance of Aluminum Company of America, to monopolize the aluminum piston field. On September 11, 1922, Packard Motor Company assigned the Gulick application to the pool (R. p. 1321), and on the next day the Gulick application was amended by changing the description from "extremely rigid" to "longitudinally rigid" and, for the first time, *adding* a suggestion that—

> "the web structure has sufficient *lateral flexibility* to permit the split to close more or less under the action of the expanding forces incident to the heating of the piston" (R. p. 1867).

In that amendment, the claim which had been involved in the Hartog-Pomeroy interference, identified as such, was inserted in the Gulick application (R. p. 1872), with a statement that

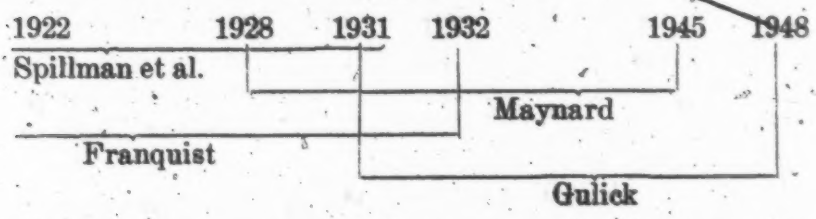
> "This interference has recently been brought to applicant's attention" (R. p. 1875).

Thereupon interferences were declared in the Patent Office between the Gulick application and the applications of Hartog, Long and others. Hartog and Long immediately questioned the right of Gulick to make the radical amendment. On April 4, 1924, a tribunal of the Patent Office (R. pp. 1548-50) sustained* Gulick's right to make the amendment, and immediately thereafter the pool matured into its full potence.

---

*Subsequently affirmed by the Court of Appeals, D. C., 17 F. (2d) 686, and followed by the Court of Customs and Patent Appeals, 47 F. (2d) 365, 366, 367.

Pistons of the type shown in the Maynard patent appeared about 1922 (R. p. 69). In 1924 the important piston manufacturers in this country pooled their interests with the obvious intention to extend the monopoly on that particular piston. This was done by bringing the then diversely owned Spillman & Mooers patent, No. 1,092,870, and Franquist patent No. 1,153,902, together with the then pending Gulick application, into the pool. Subsequently Respondent acquired a one-half interest in the Maynard patent, No. 1,655,968. The decision of the Circuit Court of Appeals in this case effectually extended that monopoly to 1948. It was done as shown in the following diagram:



Before they expired, Respondent represented that the pioneer Spillman & Mooers and Franquist patents were responsible for the success of the aluminum piston (R. p. 1120-1123). Licenses were issued (R. p. 1381, 1408, 1414), royalties collected (R. p. 102), suits brought (R. p. 101, 109), judgments recovered (R. p. 1341), relying upon those patents as dominating flexible aluminum pistons, and they were generally acquiesced in. But upon the trial of these cases, *after those patents had expired*, they were renounced by Respondent and *denounced* (R. pp. 99-100, 107, 109, 177, 247) by Respondent's expert as inflexible and unsuited for aluminum construction.

The Decisions of the Master and the District Court.

The Master held the Gulick patent invalid *in toto* because of the attempt to broaden the original application as against

intervening rights (Fact finding 15, R. p. 1107), relying upon this Court's decision in *Powers-Kennedy Corporation* v. *Concrete M. & C. Co.*, 282 U. S. 175 (R. p. 1156). The Master and the District Court took due notice (R. pp. 1150, 1229) of the fact that the Patent Office tribunals, as well as the Court of Appeals for the District of Columbia and the Court of Customs and Patent Appeals, had held that Gulick was within his rights in making the beforementioned radical change in his application. The Master explained his refusal to follow those decisions on the ground that this Court's subsequent decision in *Permutit* v. *Graver*, 284 U. S. 52, had removed the legal basis for them; furthermore, the factual basis upon which those previous decisions had been predicated was, in this case, admitted* by Respondent's expert witness to have been erroneous. The Master held in effect that this overcame the presumption of validity to which the Gulick patent was normally entitled. The District Court was urged, but declined, to overturn the Master's Report upon the basis of this Court's, then recent, decision in *Radio Corporation of America* v. *Radio Laboratories*, 293 U. S. 1.

The Decision of the Court of Appeals:

The Circuit Court of Appeals followed the decisions of the Patent Office Tribunals and the administrative courts, without regard to the two very cogent reasons assigned by the Master for his refusal so to do. The Circuit Court of Appeals was erroneously led to follow those decisions by what it understood to be the admonition of this Court in *Radio Corporation of America* v. *Radio Laboratories, supra*, where this Court said that a patent which issued pursuant to pro-

*That inherent flexibility could not be relied on (R. p. 229). That "extremely rigid" was incompatible with flexibility (R. pp. 149-150). That webs can be made non-flexing (R. p. 154). That it was necessary to deliberately design the webs to secure flexibility (R. p. 156, 229).

tracted contest in the Patent Office was endowed with a presumption of validity "not to be overthrown except by clear and cogent evidence" (293 U. S. 2). The Circuit Court of Appeals did not, as the Master and the District Court had done, regard the abolition (by *Permutit* v. *Graver*, 284 U. S. 52) of the legal basis for the administrative decisions, or the admission (abovementioned) in this record, of the incorrectness of the factual basis therefor as sufficient to overcome the strong presumption of validity.

It is clear from a reading of the decision of the Court of Appeals that the Court was moved to hold the Gulick and Maynard patents valid because of assumed "commercial success." The only evidence adduced to prove this was evidence of the payment of royalties under the *eighty* patents in the pool. That was not contradicted, but by cross-examination of Respondent's witnesses it was shown that the success of the aluminum piston was ascribable to other things.* From that evidence the Circuit Court of Appeals inferred (R. p. 2387) that the Gulick and Maynard patents had made the aluminum piston a success.**

---

*In other litigation Respondent's expert had testified that the inventions of other patents made the aluminum piston a success (R. p. 91). Respondent had represented the now expired Spillman *et al.* and Franquist patents as being responsible for the commercial success of aluminum pistons in other litigation, had obtained judgments restraining infringements and had collected royalties upon them (R. p. 1122, 1184). That from seven to ten million aluminum pistons had been made before the advent of the Gulick and Maynard patents (R. p. 92).

**The Master stated in his Report (R. pp. 1182-3):

"The situation here is peculiar, for the structures of none of the pistons (patents) in suit have ever gone into commercial use. That of Schmiedeknecht, Mooers, Gulick and Jardine not at all, while as to the Maynard design, the proof is that it was not used successfully until it had been provided with the Keystone relief. Particularly as to the Maynard piston it was discarded by Chrysler, an unwilling party plaintiff which has the right to its use as a half-owner of the patent."

"The plan of plaintiff and its licensees has been to control the market in the manufacture of aluminum pistons, and former competitors Bohn Aluminum & Brass and Kant-Skore became sub and collateral licensees."

The Court of Appeals in describing (R. p. 2386) the combination contemplated by the Gulick patent, which it held patentable, included "webs laterally flexible"; and likewise, in describing (R. p. 2392) the combination of the Maynard patent, which it held patentable, the Court of Appeals included "flexible webs." *The Maynard patent does not state whether the webs are flexible or rigid.* The Gulick patent, as *issued*, says that the webs are flexible, but the application therefor, as *filed*, described the structure as "extremely rigid."

The Circuit Court of Appeals, therefore, as to each patent, found the patentable combination to include an *element not described* in the patent applications, *as filed*.

Reasons Relied Upon For the Allowance of the Writ.

Petitioners believe that writ of certiorari should be granted in these cases for the following reasons:

I.

That the Circuit Court of Appeals for the Sixth Circuit misinterpreted or unduly limited this Court's decision in *Permutit* v. *Graver*, 284 U. S. 52, by refusing to hold a patent invalid where a feature found to be an essential element of the patented combination was not described in the application for patent *as filed*.

The combination found patentable by the Court of Appeals included "flexible webs." The Gulick application was amended five years after it was filed, to describe the essential element (flexible webs), and issued as thus amended. The Maynard patent does not now and never did contain a description of the flexible web. The patent drawing is the only basis for the decision of the Circuit Court of Appeals that the web of either was flexible, but Respondents' own witness said inherent flexibility was not enough. The decision as to the Maynard patent is, therefore, directly in conflict with

this Court's decision in *Permutit* v. *Graver, supra.* The decision as to the Gulick patent raises the *novel question* whether, under the decisions in *Permutit* v. *Graver, supra,* and *Powers-Kennedy Corporation* v. *Concrete M. & C. Co.,* 282 U. S. 175, 185, it is permissible to so amend a patent application as to antithetically change the described characteristics of an essential element on the basis of alleged inherence* in the structure shown by a drawing, especially when the amendment is made more than two years after the original application was filed, during which time adverse rights had arisen. This question is important and should, it is submitted, be settled by this Court.

The Circuit Court for the Sixth Circuit has showed its disposition to limit the doctrine of this Court's decision in *Permutit* v. *Graver, supra,* not only by refusing to apply it in this case, but by expressly limiting it, as in *Chicago Forging & Manufacturing Company* v. *Bade Cummins Manufacturing Company,* 63 F. (2d) 928, l. c. 929-930 and *Wadsworth* v. *Westinghouse,* 71 F. (2d) 850, l. c. 852. On the other hand, the courts in the other circuits have applied *Permutit* v. *Graver* to a fuller extent. [*Standard Oil Company* v. *Globe Oil and Refining Company,* 82 F (2d) 488, C. C. A. 7; *Kessler* v. *Buick Motor Company,* 64 F. (2d) 599, C. C. A. 5; *Zenitherm Co.* v. *Art Marble Co.,* 56 F. (2d) 39, C. C. A. 5; *Schindler & Co.* v. *Saladino & Sons, Inc.,* 81 F. (2d) 649, C. C. R. 1; *Anchor Cap & Closure Corp.* v. *Linhardt,* 56 F. (2d) 542, C. C. A. 8; *Helfrich* v. *Solo,* 59 F. (2d) 525, C. C. A. 7.]

II.

The Court of Appeals misinterpreted or unduly limited the doctrine of *Adamson* v. *Gilliland,* 242 U. S. 350.

The Circuit Court of Appeals held (R. p. 2387), that the aluminum piston problem was not solved until the alleged

*Contrary to the original description.

inventions of the Gulick and Maynard patents, *only* upon evidence as to the payment of royalties under *eighty pooled patents*, although it was developed on the cross-examination of respondents' witness that the success of the aluminum piston was ascribable to *other things* than the alleged Gulick and Maynard inventions. In so doing, it overruled the Master who had heard and seen the witnesses. Although there was no conflict of testimony on this point, there was evidence consistent with the Master's finding. In *Adamson v. Gilliland*, 242 U. S. 350, at 353, this Court said:

> "so far as the finding of the master or judge who saw the witnesses 'depends upon conflicting testimony or upon the credibility of witnesses, or so far as there is any testimony consistent with the finding, it must be treated as unassailable'."

An important question is thus presented whether, under the doctrine laid down in *Adamson* v. *Gilliland*, an appellate court may overrule the finding of the trial judge who has heard and seen the witnesses, where there is no conflict in their testimony, where such testimony is consistent with the trial judge's finding of fact, and where such finding is not clearly wrong.

The doctrine of *Adamson* v. *Gilliland* is one which is frequently relied upon in patent cases. The courts of the various circuits do not apply it uniformly. Some of the Courts of Appeal have come to substantially disregard the doctrine of that case, but other Courts of Appeal, as for instance in the 9th * and 10th ** Circuits, follow it scrupulously. The importance of clarifying the doctrine of *Adamson* v. *Gilliland* is emphasized by the fact that a number of

---

*Stoody Co. v. Mills Alloys, Inc., et al, 67 Fed. (2d) 807.

**Freiberg v. Pierce, 83 Fed. (2d) 961; Independent Oil Well Cementing Co. et al. v. Halliburton et al., 54 Fed. (2d) 900.

times * during the last two and current terms of this Court, petitions for writ of certiorari based upon that case have been filed.

III.

The Circuit Court of Appeals for the Sixth Circuit misinterpreted or unduly extended the doctrine of this Court's decision in *Radio Corporation* v. *Radio Laboratories*, 293 U. S. 1, by refusing to hold that the "clear and cogent evidence", stated to be necessary to overcome the presumption of validity of a patent which had been issued after a contest, was not presented, when it was made to appear (as the Master in the District Court found that it had been) that the *legal basis* for the decisions of the Patent Office and administrative tribunals was shown to be wrong by this Court's subsequent decision in *Permutit* v. *Graver;* and when it was made to appear by testimony of Respondents' own witness that the *factual basis* for the administrative decision, inherent flexibility of webs in the piston shown in the patent drawing, was insufficient.

The Master and the District Court refused to follow the decisions of the administrative tribunals approving the radical amendments made in the Gulick application because this Court's decision in *Permutit* v. *Graver* overcame the legal basis upon which those decisions were predicated. Furthermore, by the testimony of Respondents' own witness in this case, the factual basis upon which the administrative decisions were predicated was overcome. The Court of Appeals, nevertheless, considered the Gulick patent's presumption of validity as unmitigated.

Lever Bros. Co. v. *Colgate Palmolive-Peet et al.*, No. 343 (1937); *D. & M. Machine Works* v. *Texas Rubber & Specialty Co. et al.*, No. 1083 (1936); *Rubin Condenser Co. et al* v. *Copeland Refrigeration Corp.*, No. 653 (1936); *The Maytag Co.* v. *Brooklyn Edison Co., Inc.*, No. 654 (1936); *C. M. Kemp Mfg. Co.* v. *Wm. F. Hoelke*, No. 901 (1935); *Rubin Condenser Co. et al* v. *Aerovox Corp.*, No. 421 (1935).

An important question thus presented is whether a patent's presumption of validity shall prevail where it is shown that the patent issued pursuant to an interpretation of R. S. 4888, subsequently held to be wrong by this Court.

Public Importance.

The pooling of patents has become a prevalent practice. Holding many patents, such a pool may say, as the pool here did, during the life of a given patent that commercial success is attributable to that patent, but after the given patent has *expired*, such a pool may, as was done in this case, attribute commercial success to a different (yet unexpired) patent. This process may be repeated indefinitely. Thus, while commercial success may be a fair symptom of invention in the usual case, the proof of such success in the case of a *pooled* patent should be beyond a reasonable doubt. Improvement will be discouraged and the public will be penalized unless the pooling of patents, and the law with reference to commercial success is limited so as to prevent a patent pool from *misappropriating* to a junior patent, the acclaim, rightly belonging to a senior patent, *after the senior patent has expired.*

The decision of the Circuit Court of Appeals in this case condones not only the pooling of patents, but the practice of radically changing the description in an application for patent so as to cover devices which have appeared on the market since the filing of the application. The situation in this case is even more aggravated than was the situation in the case of *Powers Kennedy Corporation* v. *Concrete Mixing & Conveying Company*, 282 U. S. 175, when this Court said:

> "When this application came into interference with McMichael's, he, of course, became familiar with Leake's claims. It is significant that he then amended his claims, almost in the very words of Leake. This of

itself destroys the patent. Railway Co. *v.* Sayles, 97 U. S. 554; General Electric Co. *v.* Sangamo Electric Co., 174 Fed. 246; Lopulco Systems, Inc. *v.* Bonnot Co., 24 F. (2d) 510."

Plainly that doctrine is not limited to an interference situation, but should be regarded as a general pronouncement against radical amendments to patent applications after adverse rights have arisen and without respect to how they arose. Otherwise the tendency will be to retard, rather than "to promote the progress of science and the useful arts."* Industry will fear improvement; patent application maneuvering will have become an instrumentality of blackmail.

The record in this case shows that Respondent has brought at least seven suits against alleged infringers within the Sixth Circuit. The pistons involved in this case are largely used in automobiles. This Court can take judicial notice of the fact that substantially all of the automobiles manufactured in the United States are manufactured within the Sixth Circuit. The Respondent declined an invitation (R. p. 22), to bring suit against Sterling Products Corporation, manufacturer of the piston accused here, in its home jurisdiction, the Eighth Circuit. As long as the decision of the Court of Appeals for the Sixth Circuit stands in this case, Respondent will have practically as much relief as it could have by bringing suits against lesser infringers in other circuits, and it is consequently doubtful that Respondent will permit another Circuit Court of Appeals to adjudicate the patents here in suit. Hence it is doubtful that this case could ever reach this Court on the basis of conflicting decisions between different Circuit Courts of Appeals. In the meantime, a large percentage of automo-

---

*Constitution Art. I, Sec. 8, Sub. paragraph 8.

bile owners in this country will pay tribute to Respondents' patent pool.

Similar circumtsances were pointed out in petitions for rehearing, which resulted in the grant of the writs, in *Paramount Publix Corp.* v. *American Tri-Ergon Corp.*, 294 U. S. 464, and *Altoona Publix Theatres, Inc.* v. *American Tri-Ergon Corp.*, 294 U. S. 477.

Prayer.

Wherefore, your Petitioners respectfully pray that writs of certiorari be issued to the Circuit Court of Appeals for the Sixth Circuit to the end that these causes may be reviewed and determined by this Court; that the decrees of the Circuit Court of Appeals for the Sixth Circuit be reversed; and that Petitioners be granted such other and further relief as may be proper.

BRIEF IN SUPPORT OF PETITION FOR WRIT OF CERTIORARI.

Opinions of Courts Below.

The Report of the Special Master before whom the case was tried on its merits is found in pages 1092 to 1189 of the Record. The Memorandum Opinion of the District Court overruling Respondents' exceptions to the Report of the Special Master and adopting the Special Master's Findings of Fact and Conclusions of Law as those of the court is found at Record page 1229 and the Decree entered pursuant thereto at Record page 1230.

The Opinion of the Circuit Court of Appeals (Circuit Judges Hicks, Simons and Allen, Judge Simons writing) is reported at 92 F. (2d), page 330 and appears at pages 2381 to 2395 of the record.

Jurisdiction.

The judgment of the Circuit Court of Appeals was entered October 8, 1937 (R. pp. 2379-80).

The statute giving jurisdiction is Section 240-A of the Judicial Code (28 U. S. Code, Sec. 347).

Statement of the Case.

The foregoing Petition contains a summary of the material facts necessary to an understanding of the reasons relied upon for the allowance of the writ as well as a statement of questions involved in the case.

Specification of Errors.

1. That the Circuit Court of Appeals for the Sixth Circuit erred in finding, and holding patentable, a combination including one element not described in the original applications for the Gulick and Maynard patents in suit, and in

refusing to follow this Court's decisions in *Permutit* v. *Graver*, 284 U. S. 52, and *Powers-Kennedy Corp.* v. *Concrete M. & C. Co.*, 282 U. S. 175, as interpreted by other Circuit Courts of Appeal.

2. That the Circuit Court of Appeals erred in accepting proof of payment of royalties under a pool of eighty patents, as proof of "commercial success" of the Maynard and Gulick patents, and in rejecting the contrary finding of the Master who heard and saw the witnesses.

3. That the Circuit Court of Appeals erred in holding that the presumption of validity of a patent, however strong, is not overcome when it is shown that the legal basis for an administrative adjudication leading to its issuance had been declared wrong by a subsequent decision of this Court; or when it is admitted that the factual basis for that adjudication was wrong.

4. That the Circuit Court of Appeals erred in reversing and in not affirming the judgment of the District Court holding the patents in suit invalid and, even if valid, not infringed; and in awarding costs to plaintiff-respondent.

ARGUMENT.

I.

The Circuit Court of Appeals, by Refusing to Apply the Doctrine of Permutit v. Graver, 284 U. S. 52 Tacitly Restricted that Doctrine.

R. S. 4888 (35 U. S. Code 33), requires an applicant for patent to file in the Patent Office a written description of his invention

> "in such full, clear, concise and exact terms as to enable any person skilled in the art or science to which it appertains or with which it is most nearly connected to make, construct, compound and use the same"

and to

> "explain the principle thereof and the best mode in which he has contemplated applying that principle"

as well as to

> "particularly point out and distinctly claim the * * * combination which he claims as his invention or discovery."

In *Permutit* v. *Graver*, 284 U. S. 52, this Court interpreted that section of the statutes and held that drawings alone, absent description of the one feature, seriously urged as the essential and characterizing feature, was not a compliance with the statute. In that case this Court further held, l.c. 60:

> "The statute requires the patentee not only to explain the principle of his apparatus and to describe it in such terms that any person skilled in the art to which it appertains may construct and use it after the expiration of the patent, but also to inform the public during the life of the patent of the limits of the monopoly asserted, so that it may be known which features may be safely used or manufactured without a license and which may not."

Since this Court's decision in *Permutit* v. *Graver* the Courts of Appeal in the First, Fifth, Seventh and Eighth Circuits have held patents invalid where they did not *describe the element relied upon* by the patentee as being the essential and characterizing one. This was done by the courts in *Zenitherm Co.* v. *Art Marble Co.*, 56 F. (2d) 39, (C. C. A. 5); *Schindler & Co.* v. *Saladino & Sons, Inc.*, 81 F. (2d) 649 (C. C. A. 1); *Helfrich* v. *Solo*, 59 F. (2d) 525 (C. C. A., 7); *Anchor Cap & Closure Corp.* v. *Linhardt*, 56 F. (2d) 542 (C. C. A. 8). In this case, for the first time since the decision of this Court in *Permutit* v. *Graver*,

supra, a Court of Appeals has held a patent valid and infringed where the novelty upon which the patentee relies was *not described* in the application for the patent *as filed.* Obviously the Court of Appeals in this case did not interpret *Permutit* v. *Graver* as the Seventh Circuit Court of Appeals did in *Helfrich* v. *Solo,* 59 F. (2d) 525 (C. C. A. 7), where that Court says:

> "Appellant has failed to disclose in his specification or claims the novelty upon which he now relies, and this we think precludes his recovery on any of his claims. Permutit Co. *v.* Graver Corporation, 284 U. S. 52, 52 S. Ct. 53, 76 L. Ed. 163; White *v.* Dunbar, 119 U. S. 47, 7 S. Ct. 72, 30 L. Ed. 303; Brown *v.* Stilwell & Bierce Mfg. Co. (C. C. A.) 57 F. 731."

In the present case the Court of Appeals described the combination of elements which it found to be patentably valid in the Gulick patent as follows (R. p. 2386):

> "But to combine insulation of head from skirt, retraction of the bosses from the skirt periphery, connection of such bosses to the skirt with *webs laterally flexible* and yet so carried from the head as to support the load upon the wrist pin with sufficient strength and rigidity, and to utilize the mechanical force of the cylinder wall upon the skirt and the thermal expansion of the bosses so as to compensate evenly and fully for head expansion and to secure a balanced flexibility of the skirt with no bending concentration at any point therein, discloses, we think, a meritorious concept beyond the reach of those skilled in the art."

As pointed out in the Petition, the Gulick application *as* originally *filed* contained no reference to flexible webs. On the contrary, the Gulick structure was originally described as an "*extremely rigid*" one. *Five years* after the filing of the application, the description was changed from "rigid" to "*flexible,*" upon the representation of Respon-

dent, assumed to be correct by the Patent Office and the administrative courts, that flexibility was inherent in the structure shown in the Gulick drawings. In this case Respondent's expert, however, admitted that flexibility was not inherent in the web structure, but that a piston had to be especially designed in order to accomplish flexibility. While, at the time the question was presented to the tribunals of the Patent Office and the administrative courts, it was the practice of the Patent Office to permit amendments describing a supposed "inherent" mode of operation or characteristic of a structure shown only in the *drawings* of a patent application, that practice was unqualifiedly overthrown by this Court's decision in *Permutit* v. *Graver, supra.*

Notwithstanding these facts, the Court of Appeals for the Sixth Circuit, pursuant to its disposition to restrict the doctrine of *Permutit* v. *Graver,* followed the decisions of the Court of Appeals of the District of Columbia, 17 F. (2d) 686, and the Court of Customs and Patent Appeals, 47 F. (2d) 365, 366, 367, without explaining in what respect, the contrary decision of the Master and the District Court was found to be in error.

Similarly, the Court of Appeals, in describing the Maynard patent combination which it found to be patentably valid, said (R. p. 2392):

> "Maynard * * * embodies the Gulick combination of skirt insulation, skirt flexibility by means of vertical slotting cooperating with longitudinal slotting, and *flexible webs* in the region of the wrist pin bosses."

As pointed out in the Petition, there is not in the Maynard patent nor was there ever in the application for the Maynard patent, a suggestion that the webs of the piston, there shown, should be *flexible.*

The essential character of *web flexibility* and its importance in aluminum pistons is a core of thought which runs through the decision of the Court of Appeals. This reflects the contention of Respondent in the courts below that *web flexibility* was the important thing, and the thing which made the aluminum piston a success.* The Court of Appeals accepted this contention of Respondent, apparently without regard to the fact that this "heart and soul" of the invention was not referred to in the *original applications* for either the Maynard or the Gulick patents.

The decision of the Circuit Court of Appeals, holding the Gulick patent valid, notwithstanding the antithetical amendment five years after filing and more than two years after adverse commercialization, is repugnant to the spirit of this Court's decision in *Powers-Kennedy Corp.* v. *Concrete M. & C. Co.*, 282 U. S. 175. In that case this Court held invalid a patent, the application for which had been radically amended in language calculated to embrace an interfering process. This Court said, l. c. 186—

"This of itself destroys the patent."

So in this case the Gulick patent application was changed from "rigid" to "flexible" to embrace flexible structures which had appeared on the market more than two years before the amendment was made.

If the Patent Office had interpreted the statute (R. S. 4888) as subsequently interpreted by this Court,** Gulick

---

*That flexibility was the difference between success and failure (R. p. 122).

**In *Permutit* v. *Graver, supra*, this Court was dealing with a patent the drawings of which showed a space. The specification was devoid of description of the function of the space but the patentee relied heavily on it. This Court held: "drawings * * * are of no avail where there is an entire absence of description of the alleged invention or a failure to claim it" l. c. 60.

A fortiori, when the description is changed from black to white, rigid to flexible.

could not have changed his description save by filing a new application, against which the statutory two-year-sale-bar would have applied.

The Circuit Court of Appeals decision with respect to the Maynard patent is directly contrary to *Permutit* v. *Graver, supra.* Pursuant to the spirit of *Powers-Kennedy Corp.* v. *Concrete M. & C. Co., supra,* the doctrine of *Permutit* v. *Graver* should also have been applied to the Gulick patent.

II.

The Court of Appeals for the Sixth Circuit unduly restricted the doctrine of Adamson v. Gilliland when it accredited the Gulick and Maynard Patents with solving the aluminum piston problem without pointing out wherein the Master and the District Court had erred in their finding that "commercial success" of the aluminum piston was due to things other than these patents.

In all of the courts below Respondent contended that the Gulick and Maynard patents should be accredited as having made possible the commercial success of the aluminum piston.* The only evidence offered to this end was evidence of the payment of royalties pursuant to licenses granted piston manufacturers under *all* of the *eighty patents* in the pool. This evidence failed to convince the Master that any of the patents in suit were commercially successful. On the contrary he discussed other facts, which he held sufficient to justify his refusal to accredit the patents in suit with commercial success. Among the reasons for his refusal were: the admission of Respondent's expert that, in previous litigation, he had claimed the commercial success of the

*Whatever success may have attended the specific construction like Exhibit 1 was largely attributable to "the strength of the hands into which the patent came' (*Textile Machine Works* v. *Louis Herch Tex. Mach., Inc.,* decided by this Court Jan. 3, 1938).

aluminum piston to be attributable to the inventions represented by other patents; that the royalties which Respondent had collected throughout the years were attributable more to the broad and pioneer character of the Franquist, and the Spillman & Mooers patents (now expired) than to patents in suit; and that *Respondent had during their lives represented** the Franquist and Spillman & Mooers patents as being responsible for the commercial success of aluminum pistons, and had sued for and recovered judgments under those patents on account of infringement by the identical accused device here in suit. The Master, in his report (R. pp. 1182-3-4), cited decisions of this court and of the various Circuit Courts of Appeals and District Courts to the effect that commercial success is not persuasive on the question of patentability where other things exist which may directly or indirectly have effected it.

More recently, the Court of Appeals for the Seventh Circuit, in *Therm-O-Proof Insulation Co.* v. *Slayter & Co.*, 80 F. (2d) 557, ruled, as the Master and the District Court ruled in this case, with reference to commercial success under such circumstances. In that case, the Court of Appeals for the Seventh Circuit said:

> "It may be that a license is granted in consideration of a cross-license, and the extensive use is in no way attributable to the alleged invention covered by the claim sued on."

The Court of Appeals for the Sixth Circuit, in reaching a contrary conclusion in this case, not only failed to give the proper force and effect to the findings of the Master

---

*The Master held (R. p. 1122-4) Respondent estopped to deny the utility of and effectiveness of those patents, as Respondent attempted to do upon the trial. The Master relied upon *Dalton Adding Mach. Co.* v. *Rockford Milling Co.*, 253 Fed. 187 (D. C. Ill.) and *Rice-Stix D. G. Co.* v. *Striven Co.*, 165 Fed. 639 (C. C. A. 8).

and the District Court, but, in effect, countenanced the pooling of patents and the practice of thereby perpetuating a monopoly by condoning the practice* of Respondent to claim commercial success and achievement for one patent *as long as it lasts*, but when it expires to claim it for *another*. It accepted proof of royalty payments as establishing "commercial success" of two of the eighty pooled patents but rejected the same proof as to another of the pooled patents (Franquist, now expired) saying (R. p. 2387) "of commercial history it has none upon this record."

III.

The Circuit Court of Appeals refused to hold that a decision of this Court, abolishing the legal basis for the grant of the Gulick patent, was "clear and cogent evidence" sufficient to overthrow its presumption of validity.

In *Radio Corp.* v. *Radio Laboratories*, 293 U. S. 1, this Court was dealing with a patent which had issued after a protracted interference contest in the Patent Office and the Courts. This Court there said that such a patent had a presumption of validity "not to be overthrown except by clear and cogent evidence." (293 U. S. 2.)

In this case the Circuit Court of Appeals, in considering the issue of Gulick's right to change his description from "rigid" to "flexible," followed the decisions of the Patent Office and the administrative courts on that issue. The Master and the District Court had held that the administrative

---

*The Master said: "Defendants urge that since plaintiff has used the Franquist patent as a basis for this trustee to keep licensees in the fold, and is disowned as it expires, that thereby arises an equitable estoppel. Having abandoned the expired patent, the plaintiff now seeks to perpetuate its monopoly, relying upon another, the newly issued Gulick patent. Defendants urge that if there is no estoppel, then a third patent might issue after the fourteen years had elapsed, replace Gulick, and the monopoly thus be perpetuated indefinitely." (R. p. 1122-3.)

decisions were based upon premises, both legal and factual, which Petitioners had shown to be false.

The legal basis for the administrative decisions was abolished by this Court's subsequent decision in *Permutit* v. *Graver*, 284 U. S. 52. That alone,* we submit, was enough to overthrow the presumption of validity.

Is such "clear and cogent evidence" provided by a decision of this Court showing the legal basis for the grant of a patent to have been wrong? Is a decision of this Court *less forceful*, in overthrowing a patent's presumption of validity, than "evidence" (in the usual sense)? The Circuit Court of Appeals has tacitly held that it was.

Conclusion.

From the foregoing, we submit, it appears that the Circuit Court of Appeals for the Sixth Circuit has misinterpreted, misapplied and refused to follow the decisions of this Court; and that questions of policy and abuse of the Patent Laws are presented, which are important not only to these Petitioners, but to the public, inventors, and industry at large.

Wherefore your petitioners pray that their petition be granted, that the writs of certiorari be issued and the causes reviewed, and the decrees of the Court of Appeals reversed.

Respectfully submitted,

THOMAS G. HAIGHT,
GEORGE L. WILKINSON,
JOHN H. BRUNINGA,
JOHN H. SUTHERLAND,

January 7, 1938.

---

*The admissions of Respondent's expert, discussed hereinbefore, also nullified the factual basis for those decisions.

REPLY BRIEF OF PETITIONERS ON PETITION FOR WRIT OF CERTIORARI.

In order to point out that this is not "an ordinary patent case," as said by Respondent, but, on the contrary, that

these cases are of great legal and public importance, we make this brief reply.

(1) It is not disputed that the Circuit Court of Appeals held **web flexibility** to be the *sine qua non* of the Gulick and Maynard patents.

Respondent says **web flexibility** is common knowledge. Today, yes. When the Gulick application was filed, no. If web flexibility had been known when Gulick filed, there is no plausible explanation of how Gulick came to describe his webs (the only "connection between the piston pin bosses and the skirt") originally as follows (Rec. p. 1839, Resp. Br. p. 18):

> "• • • the above described construction also provides an extremely rigid connection between the piston pin bosses and the skirt of the piston" • • • (emphasis supplied).

It was not until after the flexible web type piston became the popular market piston, through the efforts of Long and others, that "web flexibility" was grafted on Gulick's application by the artifice of amendment, five years* after filing, as follows (Rec. pp. 1839, 1867):

---

*Nearly six years after the production of such a piston by Long, a competitor, nearly five years after such Long pistons appeared on the market, over two years after adoption of such Long pistons by Franklin Automobile Company, over two years after the published description of such a Long piston by an engineer of Packard Motor Company, over a year after the advertisement of such a Long piston by Long's licensee (Findings of Fact 21, Rec. p. 1193), and after Gulick's assignee, Packard Motor Company, obtained knowledge of an interference proceeding (Rec. p. 1275) between two other applications pending in the Patent Office involving a claim directed to such a piston construction.

"the above described construction also provides ~~an~~ *a longitudinally*
~~extremely~~ / rigid connection between the piston pin
guide portion
bosses and the ~~skirt~~ / of the piston, which construction may be used either with or without the split
guide portion
~~skirt~~ / and separated head. The arrangement of the supporting flanges 17 between the ends of the piston pin
both
bosses and the connections of those flanges with / the piston skirt provide a particularly strong ~~support for the bosses~~ *construction, and at the same time when the longitudinal split is used, as shown, the web structure has sufficient lateral flexibility to permit the split to close more or less under the action of the expansion forces incident to the heating of the piston.*" (Added matter in italics; original text in regular type; cancellations lined.)

Then and there was the first hint of web flexibility injected into the application. Then and there, the web, which, *for five years*, had been extremely rigid was changed to "longitudinally rigid—laterally flexible." That the two are incompatible, see testimony of Respondent's expert, Record pages 149-150:

"Q. But reading it without that careful word 'longitudinally' when it states 'also provides an extremely rigid connection between the piston pin bosses and the skirt of the piston,' one would naturally assume that the 'extremely rigid connection between the piston pin bosses and the skirt of the piston,' is this web connection right here about at 16, Fig. 1; isn't that right?

A. It would have to be in the connection between the

boss portion and the skirt portion. But then so far as rigidity is concerned that is, of course, incompatible with flexibility. He does have a rigid piston longitudinally, a flexible piston laterally." (Emphasis supplied.)

The above testimony of Respondent's expert witness completely refutes the argument in Respondent's brief (pp. 18 and 19) that "rigid connection" referred to in the Gulick original application meant vertical rigidity and lateral *flexibility*.

Respondent says that the drawings of the Gulick application showed the skilled in the art that there was web flexibility, and that the amendments were made to teach the unskilled* (Brief p. 18). It is immaterial that the experts "looking at the drawings" (Resp. Brief p. 3) alone, thought the structure shown would be flexible, because both agreed that the written words "extremely rigid" completely negatived any possibility of it.** If, as this Court held in Permutit v. Graver, 284 U. S. 52, drawings alone, in the absence of description, cannot repair a defect in disclosure, *a fortiori*, must the law be so when the written description is directly contrary.

The pretense (Resp. Br. pp. 11-13) that "flexibility" was injected to describe a known property of an element rather

---

*This is a plain misstatement. It is familiar law that the patent specifications are addressed, not to the unskilled, but to the skilled in the art. Carnegie Steel Co. v. Cambria Iron Co., 185 U. S. 403, l. c. 437:

"The specification of the patent is not addressed to lawyers, or even to the public generally."

**Petitioners' witness Stellman, Rec. p. 873:

"A. He describes a very rigid section between the wrist pin bosses and the skirt of the piston, designated by 17 and 18 in Fig. 4.

Q. Would that convey to your mind that the structure was intended to be very flexible?

A. No, sir; I should say that he intended that it should be rigid."

than to describe essential structure and principle of operation (description of which is required by R. S. 4888, 35 U. S. Code 33) shows the desperation of Respondent to excuse its conduct. A "property" is an inherent thing, and that more than inherent flexibility is required, there can be no doubt from the testimony of Respondents' expert witness:

> "Q. You cannot rely upon the inherent flexibility of any given structure, then, to produce that result, can you? A. No. I think not" (Rec. p. 229*).

The question presented is whether the ruling of the Circuit Court of Appeals for the Sixth Circuit (that "web flexibility" was not only properly a part of the Gulick disclosure, but that "web flexibility" was an essential element of the piston) is compatible with Permutit v. Graver, 284 U. S. 52, and Powers Kennedy C. & M. Co. v. Concrete Mixing Co., 282 U. S. 175, as this Court intended that those decisions be interpreted and applied.

The fact that Respondent, in an effort to support the decision of the Circuit Court of Appeals, has gone to the extreme of contending that it is the drawing, and the drawing alone, of the Gulick patent which makes the disclosure, and that the original specification should be ig-

*See also Rec. p. 229:

"Q. In other words, there must be a deliberate design of the web to produce flexibility?

A. I don't know that there must be deliberate design to produce flexibility, if the design is capable of doing that, but there certainly must be a correct proportioning of the different parts as to location and thickness in order to produce the desired results."

Rec. p. 156:

"Q. You wouldn't say, then, that the inherent flexibility of any structure having cross webs is then sufficient to permit a skirt to contract circumferentially in order to compensate for expansion?

A. No, I would not. This contraction is not a circumferential contraction in the sense that the entire circumference is contracted. It is a reduction of diameter by the closing of this slot, by the general cantilever principle."

nored in so far as it is inconsistent with what is now claimed for the drawing, shows, upon its face, that the Circuit Court of Appeals misinterpreted the cases of Permutit v. Graver, supra, and Powers-Kennedy C. & M. Co. v. Concrete Mixing Co., supra.

(2) Respondent seeks to negative our suggestion of public importance by setting itself up as a benefactor enabling "individual inventors" to "realize remedies which the public intended they should have." Of the eighty patents held in Respondents' pool, the only individual-inventor-beneficiaries are L. P. Mooers (apparently the promoter of the scheme) and H. J. Hater (whose fifty shares were originally issued to his company, Rec. p. 1409). Whether for or against public policy, the scheme is one to enable the pool to claim success and importance for any chosen patent during its life, but thereafter to denounce it as no good; to say of any chosen patent that it, and not the other seventy-nine, is the reason why royalties are paid to the pool; and to say to manufacturers that while the record shows you pay a penny a piston, you get most of this back, and the pool gets the opportunity of claiming commercial success.

Respondents' brief (pp. 22 and 23) raises the additional question whether, by the adoption of Equity Rule 61½, this Court mitigated the standing which, in Adamson v. Gilliland, 243 U. S. 350, it had accorded the report of a Master who saw and heard the witnesses. Respondent says, in effect, that the Court of Appeals for the Sixth Circuit has never treated such a Master's Report "as unassailable" (Adamson v. Gilliland, supra), but, on the contrary, has regarded it as merely "presumptively correct" (Equity Rule 61½).

Respondents' admission (Br. pp. 4-5) that the Department of Justice is now investigating its "repository of patents," as well as the Aluminum Company of America, is a concession that Respondent has manipulated its "repository of patents" to the injury of the public, and is an admission of the public importance of these cases.

(3) It is not denied that Respondent can get practically complete nation-wide enforcement of its patents without going outside the Sixth Circuit. Respondent says that while the automobile manufacturers are in the Sixth Circuit, some of the piston manufacturers are not. The automobile manufacturers are users and sellers, hence as subject to suit as these Petitioners, and one of them (Chrysler) has already been sued (in the Sixth Circuit). Respondent could, of course, go outside the Sixth Circuit to sue piston makers, but we say it has not and it need not. In fact, the maker of the piston accused here invited (Rec. p. 22) Respondent to bring suit against it in its home jurisdiction, the Eighth Circuit, but Respondent would sue only its customers, until finally that maker sued Respondent for an injunction to restrain unfair trade practice, and Respondent counterclaimed (in the Sixth Circuit) for patent infringement.

We submit that the legal and public importance of these cases is sufficient to justify the granting of the writs, and it is prayed that the writs be granted.

Summary of argument	16
Argument	17
Point I. The Circuit Court of Appeals treated "webs laterally flexible" as essential elements of the Gulick patent and held (a) the patent valid notwithstanding that such elements were added to the specifications by amendment nearly five years after the application was filed and more than five years after pistons employing such webs were in commercial use by others, (b) although the specification as originally filed described those webs as "extremely rigid." The Court of Appeals approved the change solely on the basis of Patent Office and administrative court decisions which in turn justified the change on an interpretation of the drawing. The decision of the Circuit Court of Appeals is, therefore, in conflict, respectively, with Powers-Kennedy v. Concrete Co., 282 U. S. 175, and Permutit Co. v. Graver Corp., 284 U. S. 52	17
The Gulick application as filed, and as amended	18

The Court of Appeals treated "Webs Laterally Flexible" as essential elements of the Gulick patent 20

The change in the Gulick application was not permissible under Powers-Kennedy Co. v. Concrete Co. 22

The change in the Gulich application was not permissible under Permutit v. Graver Corp.. 26

The factual basis for the change in the specifications and upon which the decisions of the Patent Office and of the administrative courts were based have been shown to be erroneous.. 30

Point II. The Circuit Court of Appeals upon respondent's contention treated "flexible webs in the regions of the wrist pin bosses" as essential elements characterizing the piston of the Maynard patent, presumably relying upon an interpretation of the drawing, notwithstanding that the specifications are silent with reference to web flexibility; its decision is thus contrary to Permutit v. Graver, 284 U. S. 52..... 35

Point III. The Circuit Court of Appeals was not justified in finding that the aluminum piston problem was solved by either the Gulick or Maynard patents or that the commercial success which has attended the aluminum piston was due to either of those patents; and it erred in overruling the Master and District Judge in these respects 38

No Gulick or Maynard pistons went into commercial use 40

The Maynard patent did not advance the art.. 41

Exhibit 1 cannot be relied upon as establishing commercial use by Gulick and Maynard.... 43

The Long pistons were in commercial use from 1917 on 45

Commercial success cannot be here based upon licenses under a patent pool..... 46

Point IV. The Circuit Court of Appeals was not justified in concluding that the presumption raised by the decisions in the interferences involving the application of the Gulick patent had not been overcome by clear and cogent evidence, and it erred in overruling the Master and the District Judge in these respects..... 50

Conclusion 52

PETITIONERS' BRIEF.

OPINIONS OF COURTS BELOW.

The Report of the Special Master before whom the case was tried on its merits is found in pages 1092 to 1189 of the Record. The Master's Findings of Fact and Conclu-

sions of Law are found in pages 1096 to 1109 of the Record. The Memorandum Opinion of the District Court overruling Respondents' exceptions to the Report of the Special Master and adopting the Special Master's Findings of Fact and Conclusions of Law as those of the court is found at Record page 1229 and the Decree entered pursuant thereto at Record page 1230.

The Opinion of the Circuit Court of Appeals (Circuit Judges Hicks, Simons and Allen, Judge Simons writing) is reported at 92 F. (2d), page 330, and appears at pages 2381 to 2395 of the record.

JURISDICTION.

These cases are here on writs of certiorari to the Circuit Court of Appeals for the Sixth Circuit under the provisions of United States Code, Title 28, § 347. The petitions for the writs were, at first, denied, but upon rehearing were granted on May 31, 1938. The judgments of the Circuit Court of Appeals were entered on October 8, 1937 (R. 2379-80).

STATEMENT OF THE CASE.

Parties and Prior Proceedings.

Petitioners were defendants in the District Court, where they prevailed. The Circuit Court of Appeals for the Sixth Circuit reversed the District Court, in part.

Respondent, The Cleveland Trust Company, is* a banking corporation holding title (under a Trust Agreement,

*Herein referred to as "Respondent" or as the "Trust Estate," Chrysler Corporation having been but a nominal and unwilling party plaintiff below.

R. 1345) to a pool of eighty odd patents (R. 2241). The patents included in the pool were assigned to Respondent by the Packard Motor Company (R. 1321), Aluminum Company of America (R. 1322) and others. All of the patents in the pool relate to pistons of the trunk type employed in internal combustion engines, particularly in automobiles.

Licenses under the pool of patents are held solely by The Aluminum Company of America (R. 1381), Bohn Aluminum & Brass Corporation (R. 1414) and Aluminum Industries, Inc. The license to Aluminum Company is exclusive to aluminum pistons (R. 1382), with collateral and sublicenses to Bohn Corporation and Aluminum Industries. All have agreed (R. 182) to pool all patents relating to pistons per se, now owned or hereafter acquired by them. All own shares of beneficial interest in the pool (R. 271), The Aluminum Company of America and the Bohn Company in their own names, and the Aluminum Industries through its officer and principal, H. J. Hater. All pay royalties to the pool on all aluminum pistons made by them and the proceeds are thereafter paid back to the beneficiaries.

Respondent brought three separate suits against the respective Petitioners (three Cleveland dealers in pistons made by Sterling Products Corporation of St. Louis, Missouri), alleging infringement of five different patents. The three cases all involve the same issues (including the same accused device) and were defended by the manufacturer, Sterling (R. 2384). They were consolidated for trial and for argument in the Circuit Court of Appeals. Respondent caused these cases to be referred to a Special Master for trial upon the merits (R. 43). The Master heard the testimony of witnesses, observed tests and considered the evidence which was introduced by the parties. He found (R. 1106-8) all five patents invalid, and further found that the patents, if valid, were not infringed by any

of the several accused devices. Respondent filed many exceptions to the report of the Special Master, but the District Court (R. 1229) overruled all of the exceptions and entered a decree (R. 1230) adopting the Master's Findings of Fact and Conclusions of Law as its own.

Respondent appealed to the Court of Appeals for the Sixth Circuit, with the result that two of the patents [Gulick No. 1,815,733 (R. 1284) and Maynard No. 1,655,968 (R. 1300)] were held to be valid (R. 2395), and to have been infringed by one accused device (Exhibit 1), which the Court of Appeals found as "the one of prime importance to the plaintiff" (R. 2393). As to remaining accused pistons, the Court of Appeals said "we find no infringement" (R. 2394).

As to patents other than the Gulick and Maynard patents, the Court of Appeals stated that "little is claimed for Moocrs and Schmiedeknecht • • • they apparently have no commercial history and have not substantially advanced the art" (R. 2393); and that "Jardine was without substantial commercial recognition" and that "whatever Jardine contributed to the art, if anything, is said to be incorporated in Maynard" (R. 2392). The Court of Appeals dismissed the bills "with respect to the alleged infringement of Jardine, Moocrs and Schmiedeknecht, without prejudice," with the "costs of appeal will be borne by the defendants" (R. 2395).

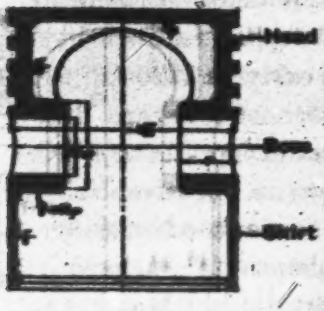
Patents in Suit and Their History.

The patents in suit relate to pistons of what is known as the trunk type, which are used in automobile engines. In such engines the pistons become hot and expand and tend to seize or stick in the cylinder. In the prior art, beginning with Respondents,' expired Spillman and Moocrs (R. 1684) and Franquist (R. 1688) patents, various expedients

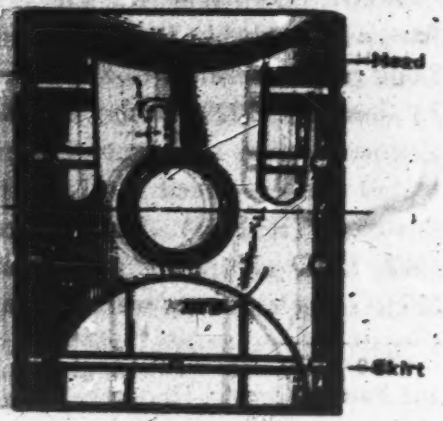
were resorted to in order to automatically compensate for such expansion.

The Court of Appeals apparently regarded the Gulick and Maynard patents as pertaining particularly to pistons made of aluminum, although neither of the patents makes any reference whatever to aluminum. The Court of Appeals also regarded these patents as pertaining to pistons of the "flexible web" type, and, indeed, found an essential element of each to reside in "webs laterally flexible," providing a connection between the pin bosses and the skirt of the piston, although there was no reference to this essential feature in the application for either of them, as filed. For the convenience of the Court we have reproduced (a) a drawing of the ordinary trunk piston of the type involved in these suits, and (b) a cross section of the piston of the Gulick patent showing the "web." This cross section does not contain the numerals which appear in the Gulick patent, as our present purpose is only to assist the Court in understanding what a web is. A true copy of the Gulick drawings appears in an appendix.

(a)
Trunk Piston.



(b)
Gulick Piston.



The importance of this feature of "webs laterally flexible," and its bearing on the question before this Court, will be further discussed in the part of this brief which is devoted to the argument of the case.

The application for Gulick patent was filed in November, 1917, but the patent did not issue until 1921. As filed in 1917, it described the piston as having webs "extremely rigid" (R. 1839). The Gulick application laid practically dormant in the Patent Office from 1917 well into 1922, and during that period of nearly five years replies were generally made to actions by the Patent Office just within the periods of one year allowed by the then existing law. No effort was made to change the description of the webs from "extremely rigid" until September 12, 1922.

During that period of nearly five years one Elmer Long had proceeded to develop his flexible web piston. Long's activities are summarized by the Master (Finding 37, R. 1102-3). Long produced his first piston in March, 1916,* and sold them as early as 1917 for replacement purposes (R. 349). Beginning April, 1920, Franklin Automobile Company sold Long's pistons in its replacement service, and as early as November, 1920, Franklin used them as standard equipment (R. 451). Respondents' witness Jeffries admitted that the Aluminum Company furnished such Long piston castings to Franklin as early as 1920 (R. 940). In January, 1920, Gunn, an engineer of Packard Motor Company, then the owner of the Gulick application, illustrated and described the Long piston in "Automotive Industries" (R. 1668). Furthermore, soon after November 1, 1919, Long shipped some of his pistons to Packard (R. 387). Long's pistons were also advertised in "Motor Age".

*This early date was also given Long by the Court of Customs and Patent Appeals; Hartog v. Long, 47 F. (2d) 369, 370.

of July 7, 1921 (R. 1621), and in "Motor World" of December 28, 1921 (R. 2271).

The Long pistons were the only aluminum pistons on the market before 1922 which compensated for expansion, and Respondents' witness Jeffries admitted this (R. 986). They were not only manufactured and sold by Long, but also by Weems, who later supplied the replacement trade (R. 374). They were sold and used by Franklin Automobile Company until 1926, when the Long piston was replaced by the strut piston, Exhibit AAA* (Jeffries, R. 1008), which is not the Gulick or the Maynard piston, neither of which was used by Franklin (Jeffries, R. 1011). Long was sued by the Trust in 1923 (R. 2261), and that suit was finally settled when Long ceased to make even piston castings and purchased the castings from the licensees under the pool (R. 290).

There is no question but that the Long piston sold to Franklin from 1920 to 1926, and even those sold to the replacement trade by Long and Weems from 1917 on, had the "webs laterally flexible," for Jeffries admitted that very thing (R. 938-9, 1006, 1009-10). There is, furthermore, no question but that these pistons had split skirts, as well as separation of the skirt from the head. A number of Long pistons are in evidence (Exs. E, F, G and FFF), as are also the advertisements of Weems and Long; these pistons were, therefore, in physical existence in the channels of trade from 1917 to 1926. A cut of the Long piston is in the Appendix.

In 1922 there were pending in the Patent Office several applications disclosing the "flexible web" type of piston. An interference involving such a piston was declared between a **Hartog** application (filed February 16, 1920, R.

*See definition of this piston, called "controlled type" (R. 1415).

1798) and a Pomeroy application, the latter owned by Aluminum Company of America. This terminated adversely to Aluminum Company of America on August 10, 1922 (R. 2279). Immediately thereafter steps were taken by Packard Motor Company and Respondent, probably with the aid and assistance of Aluminum Company of America, to monopolize the aluminum piston field. Aluminum Company was then the owner of broad patents covering processes and molds for producing chill cast aluminum alloy pistons and even covering the piston castings per se.*

On September 11, 1922, Packard Motor Company assigned the Gulick application to the pool (R. 1321), and on the next day (nearly five years after it was filed and over five years after the Long piston appeared on the market, and over two years and six months after Hartog had filed), the Gulick application was amended by changing the description from "extremely rigid" to "longitudinally rigid" and, for the first time, adding a suggestion that:

> "the web structure has sufficient lateral flexibility to permit the split to close more or less under the action of the expanding forces incident to the heating of the piston" (R. 1867).

In that amendment, the claim which had been involved in the Hartog-Pomeroy interference, identified as such, was

*See Aluminum Company of America v. Sterling Products Co., 66 F. (2d) 958, C. C. A. 8, which enumerates and discusses the scope of these patents. The Master referred to this case (R. 1141). Likewise did Respondents' witness Jeffries (R. 90, 91), who also described the procedure (R. 104-5), and indeed states that the advent of the aluminum piston began with that procedure (R. 95, 100), and indeed is what made it successful (R. 144).

inserted in the Gulick application (R. 1872), with a statement that:

> "This interference has recently been brought to applicant's attention" (R. 1875).

Thereupon interferences were declared in the Patent Office between the Gulick application and the applications of Hartog, Long and others. Hartog and Long immediately questioned the right of Gulick to make the radical amendment. On April 4, 1934, a tribunal of the Patent Office (R. 1548-50) sustained* Gulick's right to make the amendment.

The Patent Pool and Its Effect.

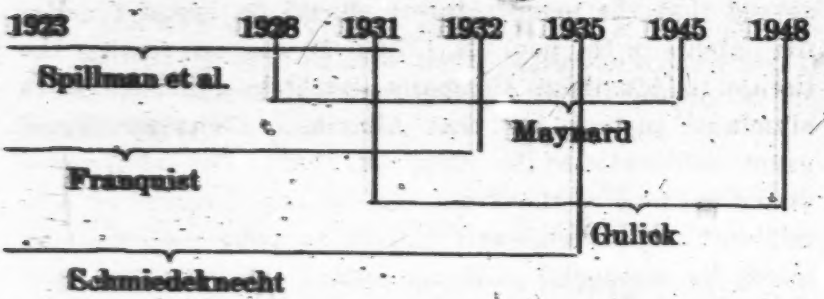
On April 11, 1934, the Trust Estate executed agreements with four piston manufacturers, namely, Aluminum Company of America (R. 1381-92), National Piston Company (R. 1403), Walker M. Levett Co. (R. 1397), and Kant-Skore Piston Company (R. 1408), wherein the manufacturers agreed to assign to the Trust Estate all their piston per se patents, then or thereafter owned, and the Trust agreed that the manufacturers should be licensed under the patents in the pool (R. 1379). It was agreed that the license to Aluminum Company should be exclusive as to aluminum pistons, but that Aluminum Company should grant sublicenses to the others (R. 1382). The sublicensees under the pool of the Trust also became licensees of Aluminum Company under its patents covering processes and molds for producing chill-cast pistons and the piston castings per se (R. 209). On September 19, 1927, Aluminum Company and the principal sublicensee (Bohn Company)

*Subsequently affirmed by the Court of Appeals, D. C., 17 F. (2d) 686, and followed by the Court of Customs and Patent Appeals, 47 F. (2d) 365, 366, 367.

both recognized that a radically different piston, namely, the steel strut piston (Exhibit AAA), came under the patents of the pool (R. 1428 and 1424).

Pistons of the type shown in Exhibit 1, found by the Court of Appeals to be that of the Maynard patent, appeared about 1923 (R. 69). In 1924, therefore, the important piston manufacturers in this country pooled their interests with the obvious intention to extend the monopoly of that particular piston. This was done by bringing the then diversely owned broad Spillman & Mooers patent, No. 1,092,570 (R. 1684), and Franquist patent No. 1,153,902 (R. 1688), together with the then pending Gulick application, into the pool. Subsequently Respondent acquired through Aluminum Company (R. 1322) a one-half interest in the Maynard patent. The Schmiedeknecht patent, No. 1,256,-265 (R. 1306), was also acquired from an incoming sublicensee (Bohn Corporation; R. 1323).

The decision of the Circuit Court of Appeals in this case effectually extended that monopoly from 1923 to 1948. It was done as shown in the following diagram:



Before they expired Respondent represented that the pioneer Spillman & Mooers and Franquist patents were responsible for the success of the aluminum piston (R. 1120-1123, 2299). Licenses were issued (R. 1381, 1408, 1414),

royalties collected (R. 102, 2299), suits brought (R. 101, 2299), judgments recovered (R. 1341), relying upon those patents as dominating flexible aluminum pistons, and they were generally acquiesced in. But upon the trial of these cases, after those patents had expired, they were renounced by Respondent and denounced (R. 99-100, 107, 109, 177, 247) by Respondent's expert as inflexible and unsuited for aluminum construction; indeed that the Franquist piston was "probably worse than a trunk piston" (R. 247) and "just plain no good" (R. 1043). Although the Schmiedeknecht patent was included in these causes (filed in 1931) as covering Exhibit 1 (R. 101), the Court of Appeals said: "Little is claimed for * * * Schmiedeknecht" (R. 2393). That was after its expiration.

The Decisions of the Master and the District Court.

The Master held the Gulick patent invalid in toto because of the attempt to broaden the original application as against intervening rights and because of material changes in the specification and claims after filing (Fact finding 15, R. 1107), relying upon this Court's decisions in Powers-Kennedy Corporation v. Concrete M. & C. Co., 282 U. S. 175 (R. 1146) and Permutit Co. v. Graver Corp., 284 U. S. 52 (R. 1151). The Master and the District Court took due notice (R. 1150, 1229) of the fact that the Patent Office tribunals, as well as the Court of Appeals of the District of Columbia and the Court of Customs and Patent Appeals, had held that Gulick was within his rights in making the before-mentioned radical change in his application. The Master explained his refusal to follow those decisions on the ground that this Court's subsequent decision in Permutit v. Graver, 284 U. S. 52, had removed the legal basis for them; furthermore, that the factual basis upon which

those previous decisions had been predicated, namely, inherent flexibility of a structure shown in the drawings, could not be relied on (R. 1152). Indeed that factual basis was, in this case, admitted* by Respondent's expert witness to have been erroneous. The Master held in effect that his overcame the presumption of validity to which the Gulick patent was normally entitled. The District Court was urged, but declined, to overrule the Master's Report upon the basis of this Court's then recent decision in Radio Corporation of America v. Radio Laboratories, 293 U. S. 1.

The Master found that none of the structures of the patents in suit, including the Gulick and Maynard patents, had gone into commercial use (R. 1182). He found specially that Exhibit 1 (the only one of the accused devices which the Circuit Court of Appeals held to infringe any of the patents in suit), did not have flexible webs (Findings 48 and 50, R. 1105), and that it employed the essential structure function and mode of operation of the Franquist patent (Finding 51, R. 1105). He further found that the piston even as illustrated in the Maynard patent never went into commercial use (R. 1162-3).

In Exhibit 1, the piston is reduced in diameter in the regions of the wrist pin bosses to "relieve" the piston in those regions, and this relief extends beyond the ends of the so-called webs into the bearing faces to provide relieved areas in the form of "keystones," and therefore

*That inherent flexibility of any given structure to produce that result cannot be relied upon (R. 229, 156); that lateral flexibility is established not merely by the presence of a vertical split, but because of the design of the webs to produce flexibility (R. 229); that there must be a correct proportioning of the different parts as related to location and thickness in order to produce the desired result (R. 229); the whole thing has to be designed with the object of gaining the mode of operation and results contemplated (R. 149).

called "Keystone reliefs." The Master found that in Exhibit 1 automatic compensation was accomplished by the "Keystone relief" and not by any web flexibility at the top because of the termination of the circumferential slotting at about the inside of the head flange (Finding 48, R. 1105). Further, that without the Keystone relief the piston of the Maynard patent was completely answered by the Franquist patent piston (R. 1163 and Finding 21, R. 1099), and was nothing but the piston of the Schmiedeknecht patent with the T-slot of the Long piston (R. 1163). A drawing of Exhibit 1 is shown in an appendix. On this drawing the "Keystone relief" is designated.

The Master witnessed the performance of tests with Exhibit 1 (R. 125), as well as with a piston of the Franquist patent (R. 1122 and 1041-2). The Master's findings were adopted by the District Court.

The Decision of the Court of Appeals:

The Circuit Court of Appeals followed the decisions of the Patent Office Tribunals and of the administrative courts, in the interferences involving the Gulick application, without regard to the two very cogent reasons assigned by the Master for his refusal so to do. The Circuit Court of Appeals did not, as the Master and the District Court had done, regard the abolition (by Permutit v. Graver, 284 U. S. 52) of the legal basis for the administrative decisions, or the admission (above mentioned) in this record, of the incorrectness of the factual basis therefor, as sufficient to overcome any strong presumption of validity.

The Court of Appeals in describing (R. 2386) the combination contemplated by the Gulick patent, which it held patentable, included "webs laterally flexible"; and likewise, in describing (R. 2392) the combination of the Mayn-

ard patent, which it held patentable, the Court of Appeals included "flexible webs." The Maynard patent does not state whether the webs are flexible or rigid. The Gulick patent, as issued, says that the webs are flexible, but the application therefor, as filed, described the structure as "extremely rigid."

The Circuit Court of Appeals, therefore, as to each patent, found an essential element of the patented combination something not described in the patent applications, as filed, and as to the Maynard patent not described in the patent as issued.

It is clear from a reading of the decision of the Court of Appeals that the Court was moved to hold the Gulick and Maynard patents valid because of assumed "commercial success." The Master found that no pistons of either of the Gulick or Maynard patents ever went into commercial use. While the Court of Appeals states that the "precise form" of the Maynard patent was sold and used to the extent of many thousands (R. 2393), the Master's report specifically shows that the evidence is the opposite (R. 1162-3). The only evidence adduced to prove commercial success was the payment of royalties under the eighty odd patents in the pool. That was not contradicted, but by cross-examination of Respondent's witnesses it was shown that the success of the aluminum piston was ascribable to other things than the patents in suit, namely, the advent of the permanent molding of aluminum pistons in 1915 (R. 144)*.

From that evidence the Circuit Court of Appeals inferred (R. 2387) that the Gulick and Maynard patents had made the aluminum piston a success.

---

*The Franquist patent, as found by the Master (R. 1119), first disclosed the fundamentals of a successful piston and under that patent the Trust has collected royalties (R. 102), brought suits and restrained infringements (R. 1341).

SPECIFICATION OF ERRORS ASSIGNED AND TO BE URGED.

1. That the Circuit Court of Appeals for the Sixth Circuit erred in finding, and holding patentable, a combination including one element not described in the original applications for the Gulick and Maynard patents in suit, and in refusing to follow this Court's decisions in Permutit v. Graver, 284 U. S. 52, and Powers-Kennedy Corp. v. Concrete M. & C. Co., 282 U. S. 175, as interpreted by other Circuit Courts of Appeal.

2. That the Circuit Court of Appeals erred in accepting proof of payment of royalties under a pool of eighty patents as proof of "commercial success" of the Maynard and Gulick patents, and in rejecting the contrary finding of the Master who heard and saw the witnesses.

3. That the Circuit Court of Appeals erred in holding that the presumption of validity of a patent, however strong, is not overcome when it is shown that the legal basis for an administrative adjudication leading to its issuance had been declared wrong by a subsequent decision of this Court, or when it is admitted that the factual basis for that adjudication was wrong.

4. That the Circuit Court of Appeals erred in reversing and in not affirming the judgment of the District Court holding the patents in suit invalid, and, even if valid, not infringed, and in awarding costs to plaintiff-respondent.

SUMMARY OF ARGUMENT.

A summary of petitioner's argument appears in the captions of the four points which are set forth in the "Argument." It is not thought feasible to expand the summary beyond these captions without unduly lengthening this brief and resorting to very considerable repetition.

ARGUMENT.

We assume that this Court will not consider any questions other than those upon which the petition for certiorari was based. Consequently, we shall not, in this brief, discuss the question of infringement, although it was petitioner's contention before the courts below and it is still insisting that its piston, Exhibit 4, infringes neither the Gulick nor the Maynard patents, even if the latter are valid. Petitioner moreover still insists that these patents are invalid over the prior art as concluded by the Master and the District Court.

Point I.

THE CIRCUIT COURT OF APPEALS TREATED "WEBS LATERALLY FLEXIBLE" AS ESSENTIAL ELEMENTS OF THE GULICK PATENT AND HELD (a) THE PATENT VALID NOTWITHSTANDING THAT SUCH ELEMENTS WERE ADDED TO THE SPECIFICATIONS BY AMENDMENT NEARLY FIVE YEARS AFTER THE APPLICATION WAS FILED AND MORE THAN FIVE YEARS AFTER PISTONS EMPLOYING SUCH WEBS WERE IN COMMERCIAL USE BY OTHERS, (b) ALTHOUGH THE SPECIFICATION AS ORIGINALLY FILED DESCRIBED THOSE WEBS AS "EXTREMELY RIGID." THE COURT OF APPEALS APPROVED THE CHANGE SOLELY ON THE BASIS OF PATENT OFFICE AND ADMINISTRATIVE COURT DECISIONS WHICH IN TURN JUSTIFIED THE CHANGE ON AN INTERPRETATION OF THE DRAWING. THE DECISION OF THE CIRCUIT COURT OF APPEALS IS, THEREFORE, IN CONFLICT, RESPECTIVELY, WITH POWERS-KENNEDY V. CON-

CRETE CO., 282 U. S. 175, AND PERMUTIT CO. V. GRAVER CORP., 284 U. S. 52.

The Gulick Application as Filed, and as Amended:

In the Appendix appears a composite of the specification of the Gulick application as filed and of the patent as issued, with the matter canceled by amendment indicated by crossing out, and with the matter added by amendment in black-face type. From this it will be apparent that the change in the specification was so bold that it is difficult to understand why the Patent Office should have permitted such amendments. We will, however, limit ourselves to the consideration of a feature found by the Court of Appeals to be an essential element of the patented combination, but which was not described in the application as filed, although it now appears in the patent, and as to which the original specification described the very opposite.

The original specification described and the drawing (see Appendix) delineated a piston comprising a **head** 10 having parts 20 depending therefrom, and in which are mounted the **"bosses"** 16 receiving the piston pin, which in turn receives the connecting rod. Flanges 17 are formed on the bosses and extend laterally in the form of **"webs"** 18 which connect with the **skirt** 11. The head and skirt are separated by a circumferential **"slit"** 12, and the skirt is **"split"** vertically at 21 between the webs.

The original specification as filed describes the nature and characteristics of the structure as follows:

> "It will be seen that in addition to providing a piston with a split skirt, the above described construction also provides an **extremely rigid connection** between the piston pin bosses and the skirt of the pis-

> ton, which construction may be used either with or without the split skirt and separated head. The arrangement of the supporting flanges 17 between the ends of the piston pin bosses and the connections of those flanges with the piston skirt provide a particularly **strong support** for the bosses" (R. p. 1839).*

The above description disclosed without question a construction which is not only rigid, but indeed "**extremely rigid**," as distinguished from "**flexible.**" This extreme rigidity is not simply described as being in the piston structure as a whole, but as being specifically in the structure of the **webs** 18 of the flanges 17, which is the only "construction" which, as described,

> "provides an extremely rigid connection between the piston pin bosses and the skirt of the piston"

and which flanges with their webs,

> "provide a particularly strong support for the bosses."*

That description was **not negatived**, but indeed supported, by the drawing. The parts 20 depending from the head to the bosses are of cross formation—a very rigid structure. The webs 18 of the flanges 17 leading from the bosses to the skirt appear in the form of chords subtending arcs of a circle—a well-known rigid structure preventing flexure of either the chord or of the arc. The skirt appears even provided with corrugations and with an inturned flange at the bottom—also well-known expedients for imparting rigidity to cylindrical structures, such as cans, drums, buckets, etc.

In short, the specification as filed described a construction which was not only rigid, but "extremely rigid," and

*Where emphasis appears in quotations, it will be understood that it is supplied unless otherwise noted.

that in the very particular parts which are in issue here, namely, the webs 18 of the flanges 17; and the drawings do not negative but rather support such extremely rigid aspect.

As shown in the Statement of the Case, the Gulick application remained in the condition with the description specifying that the webs provide "an extremely rigid connection between the piston pin bosses and the skirt of the piston," until September 12, 1922, **over five years** after Long pistons having "webs laterally flexible," were on the market and in public use and on sale, and Gulick's assignee had known of Long's commercial piston since 1919. On September 12, 1922, the specification was amended and altered (see Appendix) as follows:

The webs, originally described as providing "an **extremely rigid** connection between the piston pin bosses and the skirt" and "a **particularly strong** support for the bosses," were now described as having "**lateral flexibility.**" The description was further dressed up to change "extremely rigid" to "longitudinally rigid" and to change "support for the bosses" to "construction."

A mere comparison of the original and amended descriptions (see Appendix) will show that the difference between the descriptions of the web structure in the application as filed November 30, 1917, and as amended September 12, 1922, is the difference between "extremely rigid" and "lateral flexibility," which descriptions are as antithetical as black is from white.

The Court of Appeals Treated "Webs Laterally Flexible" as Essential Elements of the Gulick Patent.

The question of whether the original application described the web structure as being "extremely rigid" or

having "lateral flexibility" is not a collateral matter, because that forms indeed the very basis of the decision of the Court of Appeals in holding the Gulick patent valid. The Court of Appeals, after enumerating the "elements" of the "combination" of the Gulick patent, stated:

> "The wrist pin bosses are pulled inwardly from the skirt periphery, and instead of being supported by the skirt are carried from the piston head by depending flanges, thus providing a vertically rigid support for the bosses with freedom of lateral motion in a direction at right angles to the load thrusts on the piston" (R. 2385).

The Court found in the Franquist patent "the broad concept of a flexible skirt" (R. 2386), and found old even "splitting the piston skirt vertically or combining the vertical and longitudinal splits into the so-called T-slot." However, the Court of Appeals did not find in the prior art a combination, including the

> "connection of such bosses to the skirt with webs laterally flexible" (R. 2386).

Finally, the Maynard patent was stated to embody "the Gulick combination," including

> "flexible webs in the region of the wrist pin bosses" (R. 2392).

The Court of Appeals, therefore, found the characteristic feature and essential elements of the Gulick patented combination to be "webs laterally flexible."

This decision of the Court of Appeals accepted the contention of Respondent as to the essential structure and mode of operation of the piston disclosed in the Gulick

patent. This will appear from the following extracts from the testimony of Respondents' expert Dr. Jeffries:

"the yielding characteristics of the web and skirt" (R. 74).

"Q. I am trying to get the pressure on the web. These webs do nothing but carry the skirt; isn't that right; these webs 17 and 18?

A. Oh, they carry the skirt and they carry the wrist pin and they flex; they have quite a number of functions" (R. 148).

"The Gulick webs, however, are flexible in the other lateral direction, which flexibility permits the opening and closing of a vertical slot in the skirt of the Gulick piston. These webs in the Gulick construction are designed to produce such flexibility" (R. 196).

"The Gulick flexibility is gained by flexible webs and flexible skirt and co-operation between horizontal and vertical slots permitting the flexing of the skirt. This may be referred to as the cantilever principle" (R. 203).

The Change in the Gulick Application Was Not Permissible Under Powers-Kennedy Co. v. Concrete Co.

The Master discussed the decisions of this Court (R. 1144-46) and came to the conclusion that the change in the Gulick application was not permissible under the decision of this Court in Powers-Kennedy Co. v. Concrete Co., 282 U. S. 175. The District Court affirmed that conclusion. The Court of Appeals apparently did not consider the Powers-Kennedy Case, but simply agreed with (R. 2391) the conclusions of the Patent Office and of the administrative courts in the interferences in which the Gulick application was involved. But the decision of the Court of Appeals of the District of Columbia (17 F. [2d] 686) was prior to the decision of this Court in the Powers-Kennedy

case. While the decision of the Court of Customs and Patent Appeals (47 F. [2d] 366) was shortly after the Powers-Kennedy decision, not only did that Court rely upon the decision of the Court of Appeals of the District of Columbia, but it apparently did not consider the Powers-Kennedy case at all.

There can be no doubt that the equitable doctrine announced by this Court in 1878 in Railway Company v. Sayles, 97 U. S. 554, 563, and adhered to in later decisions, particularly in 1930 in Powers-Kennedy Co. v. Concrete Co., applies here with such force as to destroy the Gulick patent.

In **Railway Company v. Sayles** this Court says, 97 U. S. l. c. 563-4:

> "It will be observed that we have given particular attention to the original application, drawings, and models filed in the Patent Office by Thompson and Bachelder. We have deemed it proper to do this, because, if the amended application and model, filed by Tanner five years later, embodied any material addition to or variance from the original—anything new that was not comprised in that—such addition or variance cannot be sustained on the original application. The law does not permit such enlargements of an original specification, which would interfere with other inventors who have entered the field in the meantime, any more than it does in the case of reissues of patents previously granted. Courts should regard with jealousy and disfavor any attempts to enlarge the scope of an application once filed, or of a patent once granted, the effect of which would be to enable the patentee to appropriate other inventions made prior to such alteration, or to appropriate that which has, in the meantime, gone into public use."

Here we have the Gulick original application which, five years after the Long piston appeared on the market, was amended to embody, not only a "material addition" but indeed a material "variance from the original"; accordingly, such addition or variance cannot be sustained. That "webs laterally flexible" constitute something material cannot be disputed, because it was that feature which the Court of Appeals found characterized the alleged Gulick contribution to the art. That "webs laterally flexible" constitute a variance from "an extremely rigid connection" is so self-evident that there can be no question about it.

Powers-Kennedy Co. v. Concrete Co., 282 U. S. 175, involved a change in the specification of an application after filing under conditions closely analogous to the situation we have here. The McMichael patent in suit was for an apparatus for mixing and conveying materials, particularly concrete, in which an air pipe was shown for the purpose of agitating the concrete and preventing it from packing. The original application was filed January 14, 1907, and changes were made in the specification and new claims were added in 1911 and expanded in 1913, particularly by assigning to an air pipe the function of impelling movement of the concrete rather than agitation so as to inject what this Court called a "so-called slug theory" into the case. This change in front appeared under the following circumstances:

A certain Leake application was filed in the Patent Office about nine months after McMichael filed, and the McMichael and Leake applications were thrown into interference; the McMichael interest, however, purchased the Leake application with the result that both patents were

granted, the McMichael patent in 1915 and the Leake patent in 1917. This Court said (p. 185):

> "'And, even if the mode of operation is as claimed, it is to be remembered that Leake in his application of October 7, 1907, uses the same words to describe the operation of his nozzles as we find McMichael subsequently inserted in his specifications and claims. When this application came into interference with McMichael's, he, of course, became familiar with Leake's claims. It is significant that he then amended his claims, almost in the very words of Leake. This of itself destroys the patent. Railway Co. v. Sayles, 97 U. S. 554; General Electric Co. v. Sangamo Electric Co., 174 Fed. 246; Lopuleo Systems, Inc., v. Bonnot Co., 24 F. (2d) 510.'"

Here, for nearly five years and while the Long flexible web pistons were on the market (for nearly three years with the knowledge of Gulick's then assignee) the Gulick application described the webs as being "extremely rigid." After Aluminum Company had lost the Hartog-Pomeroy interference based on claims and descriptions in a Hartog application filed February 16, 1920 (R. 1798), and after Gulick's then assignee had obtained knowledge of that interference (R. 1875), the Gulick application was assigned to the Trust Estate and on September 12, 1922, was amended to change the description of the webs from "extremely rigid" to "laterally flexible." This, as in the Powers-Kennedy case, was "almost in the very words" of Hartog and, of course, described the Long pistons which admittedly had webs laterally flexible (Jeffries, R. 938-9, 1006, 1009-10). The Powers-Kennedy case is directly in point and the principle of that decision renders the Gulick patent invalid.

The Change in the Gulick Application Was Not Permissible Under Permutit v. Graver Corp.

The Master considered Permutit v. Graver, 284 U. S. 52, and concluded (R. 1150-1):

> "While the decisions of the Patent Office in the several piston cases were affirmed by Courts on appeal, such decisions now appear to have been founded upon a misconception of Revised Statute 4888, as were prior decisions of the Federal Courts which were overruled by the Supreme Court in the recent Permutit Co. v. Graver Corp., 284 U. S. 52."

The District Court affirmed the Master. The Court of Appeals, however, completely ignoring the fact that this court's decision in Permutit v. Graver was subsequent to the decisions of the administrative courts approved the decisions of the administrative courts, despite the fact that the description of the web structure had been changed from "extremely rigid" to "laterally flexible." That, we contend, was directly contrary to Permutit v. Graver. It will be recalled that in that case this Court held that if the specifications did not describe an essential element, it could not be supplied by reference to the drawings, it being permissible to refer to the latter only "for illustration" or "as an aid in interpreting the specifications or claim."

While Permutit v. Graver was a case involving failure of the specification of an issued patent to describe an essential part of the alleged invention of the patent, the logical conclusion is that if a court may not read into a specification of an issued patent something shown only in the drawing, certainly the Commissioner of Patents cannot permit a specification to be amended on any such basis, especially where, as in this case, the changed description

is the very antithesis of what was originally described in the specification, particularly when it is made long after intervening rights have arisen. Railway Company v. Sayles, 97 U. S. 554, and Powers-Kennedy Co. v. Concrete Co., 282 U. S. 175, cited under the preceding heading, were cases involving changes of the specification as filed, particularly against intervening rights.

R. S. 4888, 35 U. S. C. 33, makes no distinction between a patent as issued and an application as filed. It provides:

> "**Before** any inventor or discoverer shall receive a patent for his invention or discovery, he shall * * * file in the Patent Office a written description of the same * * *."

R. S. 4888 also requires that an inventor of a machine

> "explain the **principle** thereof and the best mode in which he has contemplated applying that principle."

There can be no doubt but that provision applies to the piston here involved. We have seen that in the Powers-Kennedy case this Court condemned the change in the specification as filed—from agitation of the concrete to impelling its movement—so as to introduce what this Court called a "so-called slug **theory.**" That, of course, involved a change introducing a different "**principle.**" Here the change in the original specification of the description of the web structure from "**extremely rigid**" to "**laterally flexible**" certainly involved a change introducing not only a different principle of operation but one which was the **very antithesis** of the principle of operation as well as of the essential structure originally described. Identically the same situation was involved in Permutit v. Graver. The Commissioner of patents should not have per-

mitted such an amendment in a pending application any more than a court should read such an amendment into an issued patent.

The situation here is substantially on all fours with the situation in Permutit v. Graver; indeed, the nature of the insufficiency is so closely analogous that the language in the Permutit-Graver case can readily be paraphrased. The case applies to the **Gulick** patent, because there was no description in the application **as filed**, nor in any original claim of "webs laterally flexible." The case also applies to the **Maynard** patent, hereafter more fully discussed, because neither in the Maynard application **as filed**, nor in the patent **as issued**, do we find any description, nor any claim, of "flexible webs in the region of the wrist-pin bosses."

In **Permutit v. Graver**, as here, the patent was contended to be for a certain structure having a certain novel characteristic feature. The patent was for a water softening apparatus which is described in the opinion of this court, 284 U. S., l. c. 55 and 56. Briefly stated, the apparatus comprised a container with water inlet and outlet connections and containing a charge of a water softening reagent (zeolite), the container having an open space above the zeolite to permit, as this court says (p. 56):

> "the zeolite to rise or boil, and to spread out and reform in the bed,"

and to provide a "free" rather than a "locked" zeolite bed.

This court says (p. 56):

> "First. The apparatus described in the specification closely resembles sand filters long used. The elements enumerated above, alone and in combination,

> are confessedly old. The only invention seriously urged under Claim 1 is the substitution of a 'free' for a 'locked' zeolite bed—a matter which is not referred to either in the specification or in the claim."

As to the Gulick application, we can paraphrase the above language as follows: "the only invention" (urged by plaintiff and found by the Court of Appeals) resides in the substitution of "webs laterally flexible" (free) for "an extremely rigid connection" (locked). Here the situation is aggravated by the fact that while in Permutit v. Graver the specification was silent, in the original Gulick application the original description was just exactly the opposite from what it was when amended.

This court further says, page 57:

> "There is no mention in the specification of either a 'free' or a 'locked' zeolite bed; or of the alleged discovery that a rising space above the zeolite bed is necessary for the successful operation of the softener."

In the original Gulick application there was no mention of any alleged discovery that "webs laterally flexible" were necessary for the successful operation of a piston, but rather than "an extremely rigid connection" was necessary.

This Court then discusses the decision of the Courts of Appeals in the cases involving that patent, which relied upon a showing in the drawing, as distinguished from a description, and this Court says, p. 59:

> "The drawing annexed to the specification, it is true, shows a layer of sand or quarts at a point above the zeolites and an unoccupied space between it and the top of the zeolite bed,"

but this Court says, p. 60:

> "Moreover, while drawings may be referred to for illustration and may be used as an aid in interpreting the specification or claim, they are of no avail where there is an entire absence of description of the alleged invention or a failure to claim it."

If drawings may be referred to only for illustration of what is described, then the web of the Gulick drawing could only be used as an aid to the original description, which was of "an extremely rigid connection"; it could not be used as an aid to the very opposite, namely, "laterally flexible." Furthermore, if drawings are of no avail where there is an entire absence of description, they surely cannot be an aid to something which is the very opposite of that originally described.

The Factual Basis for the Change in the Specifications and Upon Which the Decisions of the Patent Office and of the Administrative Courts Were Based Have Been Shown to Be Erroneous.

The Master, after considering Permutit v. Graver, found as follows (R. 1152):

> "There were no metes and bounds fixed in the Gulick structure, and plaintiff must fail if inherent flexibility is relied upon, as was done in the Patent Office."

It will be seen by an examination of the opinions of the Patent Office tribunals and the administrative courts, that they found that the web shown in the drawings of the Gulick patent was **inherently flexible.** They thought that the change in the specifications was justified in view of this fact. The Circuit Court of Appeals relied upon those

decisions (R. 2385). The evidence in the case at bar, however, shows that **inherent** flexibility is not enough, but that, in order for a web to be latterly flexible so that the piston may properly function, it must be specifically designed to secure the desired result. This appears from the testimony of respondents' own witness, **Dr. Jeffries.** This fact demonstrates the correctness of the decision in **Permutit v. Graver**, supra, as it does also that the Circuit Court of Appeals erred in not holding that that decision was applicable to and governs the case at bar.

When Dr. Jeffries was cross-examined about the expression "an extremely rigid connection," as found in the original application, he not only admitted that it had reference to the **web 18** (R. 150), but he specifically says:

> "It would have to be in the **connection between the boss portion and the skirt portion.** But then so far as **rigidity** is concerned, that is of course **incompatible with flexibility.** He does have a rigid piston longitudinally, and a **flexible** piston laterally."

Finally, Dr. Jeffries had to admit that the **sole descriptive basis** for "webs laterally flexible," as found in the Gulick patent as issued, is found in the **part added by amendment** (R. 173).* Since, therefore, the description

---

*"Q. Now, you don't find any description in the Gulick patent as to definite proportioning of thickness of web to secure flexibility, do you? A. Yes.

Q. You mean a specific statement to that effect, that the web is proportioned to secure flexibility? A. Well, I will find what I had in mind on that point. (After examining patent.) Beginning line 17, page 2, 'The arrangement of the supporting flanges 17 between the ends of the piston pin bosses and the connections of those flanges with both the piston guide portion and the head provide a particularly strong construction and at the same time, when the longitudinal split is used, as shown, the web structure has sufficient

was only in the amendment, Respondent had to rely solely on the drawing. As to what the drawings tell him, Dr. Jeffries testifies as follows:

> "Q. Well, I am asking now about the drawings. You can read drawings, and to your mind they give you a complete picture, don't they?
>
> A. Fairly complete, yes.
>
> Q. And those drawings, with the simple statement that the piston is made to take care of expansion, that would be enough to give you the idea that the webs should be properly proportioned to flex?
>
> A. I think so.
>
> Q. Due to the inherent structure?
>
> A. Yes" (R. 158).

In other words, "inherent structure" of something shown in the drawings was again relied on here, as in the Patent Office and before the administrative courts. Let us now see what Dr. Jeffries further said about that, particularly on Cross-Examination.

Dr. Jeffries testified as follows:

> 1. That inherent flexibility of any given structure

---

lateral flexibility to permit the split to close more or less under the action of the expansion forces incident to the heating of the piston.'

Q. You think that is full and complete? A. Yes, that is a complete statement as to the function and mode of operation of those webs.

Q. Particularly from lines 24 to 27, isn't that right? A. Yes, when the longitudinal split is used; that is, from *lines 23 to 27*.

Mr. Bruninga: Well, just as part of the defense, in order to connect it up, I want to say that we will show that that was *added by amendment*" (R. 173).

to produce that result cannot be relied upon.* ††

2. That lateral flexibility is established not merely by the presence of a vertical split, but because of the design of the webs to produce flexibility.*

3. That there must be a correct proportioning of the different parts as related to location and thickness in order to produce the desired result.*

Dr. Jeffries also sets out the following limitations: that flexing is not only a matter of size, but is also a matter of construction (R. 155); that the web thickness is a complicated thing and depends upon the functions required to be performed (R. 152); that the desirability for lateral flexibility determines the thickness of the webs (R. 148); that the webs can be made too flexible for proper functioning (R. 149 and 263); that there is a maximum web thickness for proper functioning (R. 155); that the webs can be made so as not to flex enough, and to flex too much for proper functioning (R. 156); that web flexibility is not merely a function of the web thickness, but is also a function of web height (R. 156), and is also a function of the web length (R. 1050); that in 1917 (when the Gulick appli-

*"Q. And flexible because there is a split between the webs? A. Flexible because of the split and because of the *design* of the webs to produce flexibility.

Q. In other words, there must be deliberate design of the web to produce flexibility? A. I don't know that there must be deliberate design to produce flexibility, if the design is capable of doing that, but there certainly must be a *correct proportioning* of the different parts as to *location and thickness* in order to produce the desired results.

Q. You *cannot rely upon the inherent flexibility* of any given structure, then, to produce that result, can you? A. *No*, I think not" (R. 269).

††"Q. You wouldn't say, then, that the *inherent flexibility* of any structure having cross webs is then sufficient to permit a skirt to

cation was filed) the design of the structure to get the right web-flexure was "quite a task" (R. 157).

Indeed, Dr. Jeffries says (R. 149):

> "Oh, I think the whole thing has to be designed with the object of gaining the mode of operation and results contemplated."

And further (R. 227-28):

> "Q. And if you split almost any Ricardo slipper vertically, no matter what the thickness is, that is the thickness that is ordinarily used in the Ricardo piston at that time, you would have enough inherent flexibility there to be operative in an engine; isn't that right?
>
> A. Yes, I think that is not a fair conclusion. That is, there first had to be the idea of making a piston of that construction operate satisfactorily, that idea utilizing the flexibility due to co-operation of the horizontal and vertical slots; and *then there had to be the matter of proportioning* the various parts so that that flexibility would be proper to properly operate in the motor."

The above testimony of Respondent's own expert, Dr. Jeffries, should be sufficient to show that in this case drawings alone are not sufficient, absent description, even if they do happen to show a construction which, if followed as to dimensions, will produce a flexible web structure.

---

contract circumferentially in order to compensate for expansion? A. *No*, I would not. This contraction is not a circumferential contraction in the sense that the entire circumference is contracted. It is a reduction of diameter by the closing of this lot, by the general cantilever principle" (R. 156).

Point II.

THE CIRCUIT COURT OF APPEALS UPON RESPONDENT'S CONTENTION TREATED "FLEXIBLE WEBS IN THE REGIONS OF THE WRIST PIN BOSSES" AS ESSENTIAL ELEMENTS CHARACTERIZING THE PISTON OF THE MAYNARD PATENT, PRESUMABLY RELYING UPON AN INTERPRETATION OF THE DRAWING, NOTWITHSTANDING THAT THE SPECIFICATIONS ARE SILENT WITH REFERENCE TO WEB FLEXIBILITY; ITS DECISION IS THUS CONTRARY TO PERMUTIT V. GRAVER, 284 U. S. 52.

The patent (see drawing in Appendix) describes a piston comprising a head A and a skirt D whose sides are dashed in to provide what the patent calls "webs F" connected to the head and carrying wrist pin bosses G. Grooves or slots E extend part-circumferentially around the piston between the head and the skirt, and a split I on one side of the skirt forms with one of the circumferential grooves a T-slot. Recesses H are formed between bottom arcuate skirt portions and the so-called webs F.

Here we again have a piston which is essentially rigid in the regions of the wrist pin bosses. The so-called webs are tied to the head at the top, while at the bottom we have an arc and a chord—an essentially rigid construction. There is not a word in either the application as filed or in the patent as issued about "flexible webs in the regions of the wrist pin bosses." The Master found (R. 1162) "Any reference to flexing of the skirt is omitted from the Maynard patent." The patent does not even say whether the piston is to be of aluminum, iron or steel.

The Court of Appeals said as to this patent (R. 2392):

> "Maynard upon a patent application filed January 3, 1921, embodies the Gulick combination of skirt insulation, skirt flexibility by means of vertical slotting co-operating with longitudinal slotting, and flexible webs in the region of the wrist pin bosses."
>
> "He also follows Jardine's simplified design to permit economical manufacture and Jardine's boss relief."

Here again the Court of Appeals' opinion was not based upon any statement in the specifications, but on the interpretation of the drawings by Respondent's expert, Dr. Jeffries. The pertinent parts of his testimony are as follows:

> "And one of the features of the Maynard piston is flexibility, and the flexibility of the skirt portion and the webs co-operate to produce the Maynard effect" (R. 122).
>
> "Q. And that would not happen in Maynard?
>
> A. That would happen in Maynard to an extent, but Maynard has flexibility.
>
> Q. Flexibility between the wrist pin bosses and the skirt section?
>
> A. Yes, and also some web flexibility at the top of the skirt.
>
> Q. Some web flexibility at the top of the skirt?
>
> A. Yes.
>
> Q. More web flexibility than Mr. Ricardo?
>
> A. Well, Ricardo has no web flexibility, because he has no place for the web to flex. He has the rigid, nonflexible structure, whereas Maynard has a flexing structure.
>
> Q. Even a flexing structure at the top of the web?
>
> A. Yes" (R. 261).

Dr. Jeffries really admitted that the Maynard patent specification does not describe the webs as even designed to flex (R. 1037):

> "Q. But can't you answer my question when I ask you, do you want the Court to understand that in the operation of the piston the part about ⅛ of an inch long flexes?
>
> A. Yes, I think it does. I think I have said that a good many times. I think I have got very good grounds for saying it, although I don't know that that itself makes a whole lot of difference, because Maynard doesn't necessarily say that that particular part has got to flex; he gives a construction which operates in a motor and the construction is similar to that construction of Exhibit 1."

It is interesting to note that Dr. Jeffries' position as to Exhibit 1, decided by the Court of Appeals to infringe the Maynard patent, was that the web "is flexible because the web is made thin" (R. 1036), although as previously shown by Dr. Jeffries a piston web in order to flex properly must be designed and proportioned so as to be neither too thin nor too thick, nor too long nor too short, nor too wide nor too narrow. Indeed, Dr. Jeffries admitted that even in a piston like Exhibit 1 the web structure, if too thick, will cause the piston "to score or to grub" (R. 1043).

Here, then, we have a situation where the Court of Appeals found an essential element, distinguishing the Maynard patent, to reside in "flexible webs in the region of the wrist pin bosses," although there is not a word about such flexible webs in even the patent as issued. That is, of course, directly contrary to the decision of this Court in Permutit Co. v. Graver Corp., 284 U. S. 52. Moreover, here again we have the same situation as we had in the

Gulick application, namely, that a piston in order to function by virtue of web flex, must have that web designed to flex, and must be proportioned to so flex, so that again any factual basis is lacking.

Point III.

THE CIRCUIT COURT OF APPEALS WAS NOT JUSTIFIED IN FINDING THAT THE ALUMINUM PISTON PROBLEM WAS SOLVED BY EITHER THE GULICK OR MAYNARD PATENTS OR THAT THE COMMERCIAL SUCCESS WHICH HAS ATTENDED THE ALUMINUM PISTON WAS DUE TO EITHER OF THOSE PATENTS; AND IT ERRED IN OVERRULING THE MASTER AND DISTRICT JUDGE IN THESE RESPECTS.

This Court, in Adamson v. Gilliland, 242 U. S. 350, 353, quoted with approval from its prior decision in Davis v. Schwartz, 155 U. S. 631, 636, as follows:

> "so far as the finding of the master or judge who saw the witnesses 'depends upon conflicting testimony or upon the credibility of witnesses, or so far as there is any testimony consistent with the finding, it must be treated as unassailable.'"

This rule was recently reiterated by this Court in Alabama Power Co. v. Ickes, 302 U. S. 464. See, also, Rule 52 of the new Rules of Civil Procedure. In the case at bar the facts were found specially by the Master and adopted by the district judge. There was ample testimony, consistent with the finding of the Master and district judge, and, as we will now demonstrate, the latter finding was not only not clearly erroneous but was eminently correct.

The reference was upon the motion of and at the insistence of Respondent (R. 43) over Petitioner's objections (R. 44); and the order directed the Master "to observe such tests as the parties may perform or cause to be performed" and to "rule upon the admissibility of evidence, and to report his conclusions of law and findings of fact" (R. 44). The Master did so. After the trial, briefs and arguments, he transmitted to counsel copies of his Draft Report and invited suggestions to the end that error might be corrected (R. 1274). Respondent's counsel acknowledged receipt of the Draft Report but specifically declined to offer suggestions or corrections (R. 1274-5).

The Court of Appeals' decision, after stating Respondent's contention that "the aluminum piston problem was completely solved by some of its assignors," enumerating Gulick, Jardine and Maynard (R. 2383), states:

> "Limited success may here and there have been attained, but the problem in its full sweep was not solved until the Gulick concept, carried forward to some extent by Maynard, with possibly some instruction from Jardine, reached commercial embodiment. Then, and then only, did the industry by acceptance of the Aluminum Company's piston answering the Maynard drawing and specification, recognize the complete solution of the problem, and the many millions that have since been sold and used have set the seal of commercial approval upon such solution." (R. 2387-88).
>
> "That the Maynard piston had a very great effect upon the industry and substantially advanced the art, there can be no doubt upon this record. In the precise form disclosed by Maynard and depicted in his drawings, many thousands were made and successfully used. In a somewhat modified form its produc-

tion and use has run into very many millions'" (R. 2393).

The respondent's claim of commercial success was presented squarely to the Master, who ruled with reference thereto as follows:

> "The situation here is peculiar, for the structures of none of the pistons in suit have ever gone into commercial use. That of Schmiedeknecht, Mooers, Gulick and Jardine not at all, while as to the Maynard design, the proof is that it was not used successfully until it had been provided with the Keystone relief. Particularly as to the Maynard piston it was discarded by Chrysler, an unwilling party plaintiff which has the right to its use as a half-owner of the patent" (R. 1182).
>
> "Nowhere in the patent (Maynard) is there any statement about Keystone relief, found necessary to make function commercial pistons like Exhibits 1 and 17" (R. 1162).
>
> "While two rough castings were produced without the Keystone relief, the record shows that after the filing of the Maynard patent application, change was made to give the Keystone relief (Ex. 22)" (R. 1162-3).

There was ample testimony consistent with the findings of the Master affirmed by the District Court, while the findings of the Court of Appeals are not consistent with the evidence, and are erroneous. This we will now demonstrate.

No Gulick or Maynard Pistons Went Into Commercial Use. This was admitted by respondent's witness Jeffries as to the Gulick patent (R. 146). As to the Maynard patent, it admittedly contains no description of the Keystone relief

(R. 130), and even the drawing does not disclose it (R. 225). It will be recalled that the Keystone relief is used in the accused Exhibit 1, and, as the Master found, permits automatic compensation for expansion in that piston (R. 1105, Finding 48). The Maynard patent does not, therefore, either describe or illustrate Exhibit 1 with its essential Keystone relief.

The finding of the Court of Appeals that "in the precise form disclosed by Maynard and depicted in his drawings, many thousands were made and successfully used" (R. 2393), was based upon the statement of respondent's witness Jeffries on direct examination (R. 78), which statement, upon cross-examination, was shown based on hearsay, for Jeffries admitted that he never installed or even saw such a piston, but saw only drawings (R. 1045); he did not even know whether any such piston ran for one hundred miles (R. 1046). Further, on cross-examination, Jeffries only produced unfinished castings (Exs. 3-M and 3-N), which admittedly did not have that Keystone relief (R. 135). On redirect examination (R. 189) he produced drawings (Exs. 21 and 22, R. 1337-40). Of these only Exhibit 22 shows the Keystone relief, but it also shows by "their wire" (evidently Oakland's) that the Keystone relief was "added" February 10, 1925, over four years after the filing of the Maynard application.

The Maynard Patent Did Not Advance the Art. If we take the piston shown in the Maynard patent, but without the Keystone relief or webs laterally flexible, neither of which is disclosed therein, then as to its fundamental structure, as stated by the Master (R. 1163):

> "The Franquist piston is a complete answer to the Maynard piston, for it shows the structure, function and mode of operation of the Maynard patent."

And as found by the Master (R. 1099):

> (21) "The Maynard patent embodies the fundamental structure of the Franquist patent No. 1,153,902, and that the splitting of the skirt by through and through slotting was within the purview of one skilled in the art."

The Court of Appeals agreed with the Master that

> "Franquist, of course, does disclose the broad concept of a flexible skirt" (R. 2386).

In the Franquist patent (R. 1688), see drawing in appendix, the head 2 of the piston is separated from the skirt by quarter circumferential slots 17 in the regions of the bearing or thrust faces 15 and the skirt is also depressed or relieved in the regions 14 of the wrist pin bosses 6. The skirt is also slotted vertically at 13 to compensate for expansion, although the slots do not go all the way through the skirt. However, the Court of Appeals agreed with the above-quoted finding of the Master that the following was also old:

> "splitting the piston skirt vertically or combining the vertical and longitudinal splits into the so-called T-slot" (R. 2386).

The Master, therefore, properly found (R. 1163):

> "that all Maynard did was to put the T-slot of Long on the piston of Schmiedeknecht."

Of course, that is all Maynard really did. The Long piston is illustrated in the Appendix in connection with the pistons of the Franquist, Schmiedeknecht and Maynard patents. Long followed the concept of Franquist in partially severing the skirt from the head by part circumfer-

ential slots. Long then provided a vertical slot which with one of the circumferential slots formed the T-slot. Maynard simply took the T-slot of Long and placed it on the Schmiedeknecht piston in the same place that Long had done. The Schmiedeknecht piston is the prototype of the Maynard piston. Indeed, it was so considered by Respondent, who not only issued licenses and collected royalties thereunder, but brought suit against and secured a decree against Sterling's customer (Simmons) by reason of Simmons selling a piston like Exhibit 1 (R. 101).

Exhibit 1 Cannot Be Relied Upon as Establishing Commercial Use by Gulick and Maynard. The Master described this piston (R. 1116) as

> "a stiff piston, being a truss construction with a chord spanning an arc, and when this piston scored, resort was had to what is now known as the 'Keystone relief.'"

The Master specifically found (R. 1105):

> (48) "That in Ex. 1 automatic compensation is accomplished by what has been termed the 'Keystone relief' and not by any web flexibility at the top; that the circumferential slotting terminates at about the inside of the head flange and that such a construction and arrangement does not secure the operation contemplated by the Gulick, Jardine and Maynard patents."

This finding was not only based on tests which the Master stated he had witnessed (R. 1092) in accordance with the Order of Reference (R. 44), as well as upon demonstrations to which he refers (R. 1122), but the above finding was based upon the testimony of Respondent's

own witness, Dr. Jeffries, who, in stating the metes and bounds of the Jardine patent piston (said by the Court of Appeals to be incorporated in the Maynard piston and to follow the Gulick patent) (R. 2392), as follows:

> "Q. Would you say that the objects and advantages and purposes of the Jardine patent are secured if the slots 29 were shortened to terminate about the inside part of the ring flange 23?
>
> A. It would be quite difficult to secure successful operation under those conditions" (R. 230-1). (See drawing R. 1294.)

That is exactly what we have in Exhibit 1, namely, the slot going into the web terminates about the inside part of the ring flange. That should dispose of this case, for the Master's finding is not only supported by the evidence, to say nothing of reason and common sense, but is affirmed by the testimony of plaintiff's own expert, Jeffries.

The Master further found (R. 1105):

> (51) "That defendants' pistons, Ex. 1, employs the essential structure, function and mode of operation of the prior art, more particularly the Franquist patent No. 1,153,902."

The Master made the above finding after witnessing tests of the Franquist piston as stated by him (R. 1122). See also R. 1041-2. Stellmann, former Chief Engineer of the Franklin Automobile Company, also explained the operation of Exhibit 1 as related to the Franquist piston, and that they are the same (R. 526). That was really admitted by Dr. Jeffries (R. 128).

It is axiomatic, of course, that an accused device (Ex. 1) cannot infringe an unexpired patent (Gulick or May-

nard) when it has the essential structure, function and mode of operation of an expired patent (Franquist), even when that expired patent is supplemented by something (Keystone relief) not disclosed in that unexpired patent, and which gives a distinctly different mode of operation. It is self-evident, therefore, that Exhibit 1 cannot be relied upon as establishing commercial success of Gulick and Maynard.

The Long Pistons Were in Commercial Use From 1917 On.

The statements of the Court of Appeals that there was only "limited success here and there" prior to the advent of the Maynard piston and that "then and then only did the industry • • • recognize the complete solution of the problem" (R. 2387-88) are not based upon the evidence, but the contrary is true.

The Maynard piston, according to Dr. Jeffries, did not appear on the market until 1923 (R. 69). But as we have shown in the Statement of the Case and as found by the Master (Finding 37, R. 1102-3), the Long pistons (see cut in Appendix) were developed as early as 1916, were sold in the replacement trade from 1917 on, were adopted by Franklin Automobile Company in April, 1920, and for standard equipment in November, 1920, and such use continued by Franklin until 1926. Indeed, we showed that Respondent's own witness admitted such use by Franklin as early as 1920. We further showed that the Long piston was replaced at Franklin in 1926, not by a Maynard piston, but by the steel strut piston, after the Trust had sued Long on the broad Spillman and Mooers patent, and after the Trust came into full potence.

Commercial Success Cannot Be Here Based Upon Licenses Under a Patent Pool.

Since no commercial use was shown by a piston of either of the Gulick or Maynard patents, the sole basis of commercial success of these patents must, therefore, be based upon the acceptance of licenses from, and the payment of royalties to, the title holder of a pool of eighty odd patents. But the nature of these patents, the circumstances of their pooling and the relations of the licensees cannot form such a basis in this case. Respondent attempted to do so by an impressive showing of the amounts of royalties which had been paid into the Trust (Ex. 13, R. 1328) and then proclaimed that the Gulick and Maynard patents, that is, two of the eighty odd patents, were responsible for it all. Petitioners, therefore, by compelling the production of the licenses and evidence relating to the formation of the pool and its operation showed the circumstances previously set out in the Statement of the Case and which may be summarized as follows:

Perfection in 1924 of a pool of patents by Cleveland Trust Company and Aluminum Company of America; with the Trust Estate holding and acquiring (nominally) all piston structure patents, including the basic Spillman and Mooers, and Franquist patents, as well as the Gulick and Maynard patents and later the Schmiedeknecht patent (the prototype of the Maynard patent piston); with Aluminum Company holding and reserving for itself the basic patents on processes and molds for chill-casting aluminum pistons and even for the chill-cast aluminium pistons per se; with an exclusive license from the Trust Estate to Aluminum Company for aluminum pistons and with concurrent sublicenses and licenses by Aluminum Company, under the Trust-held patents and the Aluminum Company

patents, to a limited number of piston manufacturers; with concurrent acknowledgment of a totally different piston (controlled type-strut, Ex. AAA) as coming under the Trust-held patents; with suits even in 1923 by the Trust and Aluminum Company against Long and another piston manufacturer; and the final elimination of Long as a competitor in 1926.

As the Master said (R. 1183):

> "The plan of plaintiff and its licensees has been to control the market in the manufacture of aluminum pistons, and former competitors Bohn Aluminum & Brass and Kant-Skore became sub and collateral licensees."

Actually at the end of 1926 there was complete control of the aluminum piston business in Aluminum Company of America with its ownership of its own chill-cast piston molding patents and with its exclusive license to aluminum pistons under the Trust-held patents. This was the situation even before the issue of the Gulick and Maynard patents, for the then issued patents of the Trust, particularly the Franquist patent, pre-empted the piston structure field, while the patents of Aluminum Company pre-empted the piston casting field. These latter, according to Dr. Jeffries, really solved the aluminum piston problem (R. 91, 100, 144). The Franquist patent did not expire until 1932 and the Aluminum Company patents did not expire until 1936. Even the Schmiedeknecht patent, which is really the prototype of the Maynard piston, did not expire until 1935.

From the above, it will be apparent that not only were the various licensees and sublicensees bound together by at least two-field ties, but there was nothing to show that

commercial success can be attributed to any two particular patents of the Trust, namely, the Gulick and Maynard patents, neither of which went into commercial use, and that no effect can be given to the licenses taken by these bound-together licensees under the Gulick and Maynard patents. The Master applied the proper rule when he said (R. 1184):

> "Until their expiration, plaintiff could rely upon the Spillman & Mooers and Franquist patents, and that piston manufacturers did not contest is no criterion of validity, for even the value and general use of a device will not sustain a patent if the lack of invention is clear. Of a situation not unlike that presented here, with the trustee owning many piston patents, Mr. Justice Holmes of the Supreme Court, in the recent Mineral Separation v. Magma Copper, 280 U. S. 400 (1930), says at page 404:
>
> > "'The petitioner adverts to the success that has attended the later patent and to the fact that the world waited until it appeared. But interlopers naturally would be slow to venture into the field occupied by a powerful company armed with Patent No. 835,120 and supported by a subtle ingenuity that we cannot doubt would have been exercised with even more effect to show that a process like that in No. 962,078 was an infringement than it now is to prove that the latter patent was a revelation that transformed the art.'"

The sum and substance of the evidence offered in connection with alleged commercial success was that the only recognition that had been given to the Maynard and Gulick patents was either of the "strong hands" type, Mineral Separation v. Magma Copper, supra, and Textile Machine Works v. Louis Hirsch Textile Machines, 301

U. S. 680, 57 Sup. Ct. 944, or of the "selfish" type discussed by Judge Tuttle in Oxford Varnish Corporation v. General Motors, 23 F. Sup. 562.

But respondent has in the courts below attempted to escape the effect of these decisions by contending that the inventions of the Spillman & Mooers and Franquist patents—after they had expired—were of no commercial utility, even to the extent of saying that the Franquist piston was "probably worse than a trunk piston" (R. 247) and "just plain no good" (R. 1043). However, this contention can be given little, if any, effect, in view of the fact, as pointed out in the Statement of the Case, that respondent, prior to the expiration of these patents, represented that they were responsible for the success of aluminum pistons, issued licenses thereon, collected royalties, brought suits, recovered judgments and, even as late as 1933, sought to have the decree in a suit in which they had recovered a judgment expanded so as to cover a piston identical with Exhibit 1. The Master discussed the evidence and the authorities (R. 1120-24) and properly came to the conclusion that respondent's attempt to renounce and denounce the Franquist patent could not be accepted, and that Exhibit 1 was based upon the now expired Franquist patent as respondent had previously contended and not on the Gulick and Maynard patents.

There has been no commercial success of anything described by Gulick or Maynard but of something discovered by Franquist in 1915, who, as stated by the Master (R. 1119), first disclosed "the conditions, fundamental means to meet those conditions, operation and results" of a practical piston, and whose disclosure has been followed by Exhibit 1. Upon expiration of that patent in 1932, that piston became free to the public to use. Even

in the specific form of Exhibit 1, it certainly became free in 1935, when the Schmiedeknecht patent expired. As will be seen from the last page of the Appendix, Exhibit 1 is simply the piston illustrated in the expired Schmiedeknecht patent, provided with the T-slot of Long, following the disclosure of Franquist, and having a Keystone relief not disclosed in either the Gulick or Maynard patents. Respondent could not by a device of pooling patents, first make use of, and after expiration of successive patents of the pool renounce them successively and transfer the claim of commercial success to later patents of the pool.

Point IV.

THE CIRCUIT COURT OF APPEALS WAS NOT JUSTIFIED IN CONCLUDING THAT THE PRESUMPTION RAISED BY THE DECISIONS IN THE INTERFERENCES INVOLVING THE APPLICATION OF THE GULICK PATENT HAD NOT BEEN OVERCOME BY CLEAR AND COGENT EVIDENCE, AND IT ERRED IN OVERRULING THE MASTER AND THE DISTRICT JUDGE IN THESE RESPECTS.

The Circuit Court of Appeals considered that because of the interferences in which the application of the Gulick patent had been involved, that it "should not be stricken down except upon very clear and convincing proof of invalidity" (R. 2388). It relied upon what this Court said in **Radio Corp. v. Radio Engrg. Labs.**, 293 U. S. 1, 2. In that case this Court was dealing with a patent which had issued after a protracted interference contest in the Patent Office and the Courts. This Court there said that such a patent had a presumption of validity "not to be overthrown except by clear and cogent evidence" (293 U. S. 2).

The District Court (R. 1229) considered that decision but decided that the presumption had been overcome. The Master refused to follow the decisions of the administrative tribunals approving the radical amendments made in the Gulick application because: first, the legal basis upon which these decisions were predicated was not sufficient in view of this Court's decisions in Permutit v. Graver, 283 U. S. 524; Powers-Kennedy v. Concrete, 282 U. S. 175; second, because the factual basis of those decisions had been dissipated by the evidence in these causes, particularly by the testimony of respondents' own witness, Dr. Jeffries.

The Court of Appeals simply agreed with and followed the decisions of those administrative tribunals (R. 2391) and in doing so went directly contrary to the decisions of this court.

The evidence in this cause is "clear and cogent" and the Court of Appeals, therefore, erred in overruling the Master and the District Judge. That evidence has been considered under Point I and need, therefore, not be further considered.

Moreover, the evidence is uncontradicted that in the Gulick application, as filed, there was no reference to laterally flexible webs, and the justification for reading them into the case relied upon by the Patent Office tribunals, the administrative courts, and the Circuit Court of Appeals was that this feature was found inherently from the drawings. The amendments which the Patent Office permitted to be made in this respect to the Gulick application were inserted long after intervening rights had arisen. The question presented, therefore, was whether a laterally flexible web which was considered by all of the courts and the Patent Office tribunals to be an essential element of

the patent could legally be considered as a part of the invention disclosed and claimed. This was a question of law to which, as we have previously endeavored to demonstrate, the decisions of this Court in **Permutit v. Graver**, supra, and **Powers-Kennedy v. Concrete**, supra, required a negative answer. The question was not whether invalidity was shown "by clear and cogent evidence," but whether, as a matter of law, a patent is valid which does not disclose, describe or discuss in its specification an element found to be essential.

CONCLUSION.

For the reasons stated, we urge that the Gulick and Maynard patents here in suit should be held invalid and that the decision of the Circuit Court of Appeals for the Sixth Circuit should be reversed.

Respectfully submitted,

THOMAS G. HAIGHT,
JOHN H. BRUNINGA,
JOHN H. SUTHERLAND,
Attorneys for Petitioners.

September 17, 1938.

APPENDIX.

Composite of Gulick Specification as Filed and as Amended.

(Cancellations shown by crossing out; additions by bold-face type.)

To Whom It May Concern:

Be it known that I, Edward J. Gulick, a citizen of the United States, and resident of Elkhart, Elkhart County, State of Indiana, have invented certain new and useful improvements in ~~Hydrocarbon Motors~~ Pistons of which the following is a specification:

1.

This invention relates to ~~hydrocarbon motors and particularly to~~ pistons ~~therefor~~.

One of the objects of the present invention is to provide a piston which is will not adapted to expand against the cylinder wall to such an extent as to ~~seize~~ cause or stick.

Another object of the invention is to provide a piston with a skirt or guide portion slightly separated from the head of the piston and split longitudinally so that it will not expand in circumference with a force great enough to cause the piston to stick in the cylinder.

Another object of the invention is to provide a piston with ~~improved lubricating means for lubricating conduits leading from the exterior of the piston~~ to the piston pin bosses.

Another object of the invention is to rigidly support the piston pin bosses of a piston from the piston walls against

mechanical load thrust from the connecting rod without interfering with the yielding characteristics of the skirt in response to cylinder wall pressure.

Other objects of the invention will appear from the following description taken in connection with the drawings which form a part of this specification, and in which:

Fig. 1 is a longitudinal sectional view through a piston embodying the invention;

Fig. 2 is similar to Fig. 1 taken at right angles thereto, being on the line 2-2 of Fig. 3;

Fig. 3 is a transverse section substantially on the line 3-3 of Fig. 1;

Fig. 4 is a transverse section on the line 4-4 of Fig. 1;

2.

Fig. 5 is a view similar to Fig. 1, showing a slightly different form of piston embodying the invention; and

Fig. 6 is a top view of the piston shown in Fig. 5.

Referring to the drawings, 10 represents the head portion of a piston and 11 is the skirt or guide portion which is shown as separated at its periphery from the head leaving an annular slit or opening 12 therebetween. The head portion of the piston is provided with an annular groove 13 for a piston ring 14, and the upper end of the skirt portion 11 is formed with a recess shown in the form of an annular groove 15 for the purpose of collecting the oil that may be scraped from the cylinder during the reciprocation of the piston.

The piston is also provided with a pair of separated piston pin bosses 16 which are formed with integral supporting flanges 17 extending around the bosses and ar-

ranged intermediate their ends. These flanges extend laterally of their respective bosses in the form of webs 18 which integrally connect with the wall of the skirt guide portion 11 as shown in the drawings. Since there are two of these webs or walls 18 for each of the bosses 16 there are therefore four connections of the webs 18 to the skirt or guide portion 11. These connections are in the four longitudinal lines as shown at 19.

The flanges 17 also extend upwardly from the bosses in the form of webs or walls 20 leading to the head 10 and thereby connecting the bosses with the head. Thus, the bosses are connected to both the head and the skirt so that the latter is held in its proper position directly beneath the head as shown in Figs. 1 and 2.

In order that the skirt may not expand an undue amount when the piston is heated, as under operating

3.

conditions, it the cylinder-engaging part of the guide at one side of the pin bosses which takes the angular thrust of the connecting rod during one stroke of the piston is split longitudinally as at 21. This split is slightly diagonal to prevent wearing a groove in the cylinder and it effects a complete severing of the guide wall so that the separated edges of the split are unrestrained for movement toward and from each other.

The piston is further provided with conduits 22 shown in the form of pipes extending from the recess or groove 15 at the upper end of the skirt to openings 23 in the bosses. There is shown one conduit for each boss and it will be understood that the oil collected in the groove 15 by the piston in its reciprocation is led down through the

conduits 22 to the interior of the piston pin boss to thereby lubricate the bearing.

The skirt 11 is formed with openings 24 in its side registering with the openings through the bosses 16 so that the piston pin may be inserted. As these openings are well above the bottom of the guide portion of the piston the lower end of the piston skirt is left unbroken, except for the split 21, and the arcuate parts of the skirt beneath said openings may be looked upon as joining the lower ends of the diametrically opposite cylinder-engaging parts of the guide that sustain the angular thrust of the connecting rod.

It will be seen that in addition to providing a piston with a split skirt, guide portion the above described construction also provides an extremely a longitudinally rigid connection between the piston pin bosses and the skirt guide portion of the piston, which construction may be used either with or without the split skirt guide portion and separated head. The arrangement of the supporting flanges 17 between the ends of the piston pin bosses and the connections of those flanges with both the piston skirt guide portion and the head provide a particularly strong support for the bosses construction, and at the same time, when the longitudinal split is used, as shown, the web structure has sufficient lateral flexibility to permit the split to close more or less under the action of the expansion forces incident to the heating of the piston.

In Figs. 5 and 6 the webs or walls 18 are slightly curved between the flanges 17 and the skirt wall guide portion to thereby distribute the connection of the bosses to the skirt guide portion more evenly around the skirt piston. Otherwise the showing is substantially the same as in the other figures. While my piston is, of course, adapted for

use in either vertical, inclined, or horizontal engines, for convenience I refer in some instances to its head end and its open end as the upper and lower ends or parts, respectively.

It will be understood further that my invention is not limited to the details of construction shown and other forms may be used without departing from the spirit or scope of the invention.

PETITIONERS' REPLY BRIEF.

Respondents' brief is divided into two sections, but they seem to cover exactly the same subject matter. We shall not attempt to answer these sections separately, but will answer the brief as a whole, with reference to the points in petitioners' brief.

Point I.

As we understand it, respondents' answer to petitioners' Point I is, (a) that the Court of Appeals did not hold that a flexible web was an essential element of the Gulick patent; (b) that the amendment which was made in the Gulick specification five years after it was filed and after the Long pistons came on the market was justified because of the alleged "inherent" lateral flexibility of the Gulick webs; (c) that the *dimensions* of the webs on the *drawings* of the Gulick patent, if followed, would produce webs laterally flexible; and (d) that the decisions of this Court in *Permutit* v. *Graver* and *Powers-Kennedy* v. *Concrete* are distinguishable from the case at bar. We will answer these propositions in the order in which we have stated them.

(1) As will be apparent from a reading of the opinion of the Circuit Court of Appeals, Gulick came into a crowded art. As the Circuit Court of Appeals said (R. 2385):

> "The Gulick patent is for a combination of elements, many, if not indeed *all of which*, are to be found in the prior art."*

The Circuit Court of Appeals then went on to describe the Gulick device and said:

> "That Spillman and Mooers patent 1,092,870, and Franquist patent 1,153,902, showed air gaps between piston head and skirt, or that splitting the piston skirt vertically or combining the vertical and longitudinal splits into the so-called T-slot were old practices, is not conclusive on the question of invention."

---

* Where italics are used in quotations, it will be understood that the emphasis is ours unless otherwise noted.

In order that this statement may be understood, we pause to briefly describe these two prior art devices. The Spillman and Mooers piston had the head completely separated from the skirt just as in the Gulick patent. It provided the same means as in the Gulick patent for holding them together and supporting the wrist pin bosses. To quote the language of the Circuit Court of Appeals:

> "The wrist pin bosses are pulled inwardly from the skirt periphery, and instead of being supported by the skirt are carried from the piston head by depending flanges, thus providing a *vertically rigid* support for the bosses * * *."

A drawing of this piston will be found in R. Vol. III, p. 1684. A cross-section model is in evidence as Exhibit 3-P. This patent, however, did not disclose a vertical slit. The Franquist patent (R. Vol. III, p. 1688), a drawing of which appears in an appendix to our main brief, had four grooves or as the patent calls them "slots," which serve the same purpose as the slit and had two air gaps between the head and the skirt, exactly as in the *accused* device, and wrist pin bosses pulled inwardly from the skirt. A vertical slit, as found by the Master and conceded by the Circuit Court of Appeals, was old. The Master said (R. Vol. II, p. 1154):

> "Slotting through piston skirts was not only old, as shown by the Ebbs patent of 1902, the Van Bever, Rainforth and Serex patents of 1912 and the Vincent patent of 1913 * * *" etc.

The Serex patents (R. Vol. III, p. 1779) show a T-slot. The Circuit Court of Appeals then went on to describe and define the Gulick invention as follows (R. 2386):

> "To decelerate the flow of heat from piston head to skirt by an air gap was perhaps an obvious expedient

in the art.* To slit the skirt vertically so that pressure of the cylinder wall would compensate for thermal expansion was perhaps not beyond expected skill in the art.** Minute relief of the cylinder periphery in the region of the bosses was shown in Franquist.*** But to *combine* the insulation of head from skirt, retraction of the bosses from the skirt periphery, connection of such bosses to the skirt *with webs laterally flexible* and yet so carried from the head as to support the load upon the wrist pin with sufficient strength and rigidity, and to utilize the mechanical force of the cylinder wall upon the skirt and the thermal expansion of the bosses so as to compensate evenly and fully for head expansion and to secure a *balanced flexibility of the skirt* with no bending concentration at any point therein, discloses, we think, a meritorious concept beyond the reach of those skilled in the art."

We think it is apparent from the above quotation that the Circuit Court of Appeals considered that one of the main elements of the Gulick invention, if not the most important one, was "webs laterally flexible and yet so carried from the head as to support the load upon the wrist pin with sufficient strength and rigidity". That is the only element which the Circuit Court of Appeals did not refer to as either in the prior art or as within the expected skill of the art. Such a web was shown in the Spillman and Mooers patent although not described as laterally flexible.

* This, as previously shown, was not only obvious but was old in Spillman and Mooers and Franquist.

** This was old in the patents referred to in the part of the Master's report above quoted. In the interference proceedings involving the Gulick application, the Law Examiner was of the same opinion regarding the non-inventive character of splitting the skirt as the Circuit Court of Appeals (R. Vol. III, p. 1660).

*** The same relief as is in Gulick is shown in Spillman and Mooers.

It is, of course, a settled rule that all elements of the claims of a patent must be considered as essential and it certainly cannot be presumed that the Circuit Court of Appeals, when it referred to the flexible web as an "element" of the combination in which the invention of the patent was found, did not treat it as an *essential* element.

(2) The Circuit Court of Appeals rested its conclusion regarding the propriety of the amendment to the Gulick specification in respect to the webs upon two decisions in interference proceedings in which the Gulick application was involved (*Long* v. *Gulick*, 17 F. [2d] 687; C. A. D. C.; *Hartog* v. *Long* v. *Gulick*, 47 F. [2d] 365, 367, C. C. P. A.). In these cases it was contended that Gulick could not make the claims there involved. It was held that he could, the reasoning being that, in view of the slit in the skirt, the purpose of the invention would fail unless the webs were made to yield. In *Long* v. *Gulick*, the Court said in addition:

> "The *drawings of Gulick*, we think, clearly disclose the structure of the count."

The courts in those cases, and the Circuit Court of Appeals in the case at bar by adopting their reasoning, have therefore held that the web shown in the Gulick drawings must be inherently flexible, otherwise the slit would not work. But, as pointed out in our main brief,* respondents' expert in the case at bar testified that in order to procure flexibility, there "must be a correct proportioning of the different parts as to location and thickness" and that one "cannot rely upon the inherent flexibility of any given structure". Not only is there not a word in the specifications of the Gulick patent, as originally drawn, as to the lateral flexibility of the webs, but

---

* P. 33.

as pointed out in our original brief, they were directly to the contrary. Respondents' brief not only controverts this proposition, but confuses the "webs" 18 here in issue with the "webs" 20.* The webs 20 are of cross formation and connect the bosses 16 to the head 10. It is through these webs 20 that the power is transmitted from the piston head to the bosses and then to the connecting rod.** It is these webs 20 that the Court of Appeals decision described as

> "providing a vertically rigid support for the bosses" (R. 2385).

But it is not the webs 20, but the webs 18 which connect the bosses with the skirt, and as to these the original specification stated (see appendix, petitioners' brief).

> "Another object of the invention is to *rigidly* support the piston pin *bosses* of a piston from the piston *walls*" (p. 53).
>
> "Provides an *extremely rigid* connection between the piston pin *bosses* and the *skirt*" (p. 53).
>
> "Provide a particularly strong support for the bosses" (p. 56).

It is these webs 18 which were by the amendment described as having "lateral flexibility", and it is these webs 18 which the Court of Appeals decided permitted the bosses to have

> "freedom of *lateral motion* in a direction at right angles to the thrust of the piston" (R. 2385)

and constituted a

> "connection of such bosses to the skirt of the piston with webs *laterally flexible*" (R. 2386).

---

* See drawing in Appendix, p. 59, petitioners' brief.
** See illustration, respondents' brief, p. 43.

We therefore find that the "inherent flexibility" upon which the District of Columbia Courts and the Court of Appeals relied is (a) diametrically opposed to the statement in the Gulick specification as originally drawn; (b) it cannot, according to the respondents' own witness, be relied upon; and (c) it depends entirely upon circular reasoning, *i. e.*, that if the webs were not flexible, the purpose of the invention would be defeated. This reasoning proceeds from a generic statement of a desired result to a specific statement of structure for producing such result. It might be that the skirt would contract at some place, but it would not follow that a particular part inside of the skirt, namely, a web, would flex laterally, particularly when the original specification stated that the web was to be "extremely rigid".

It is not proper to make out a disclosure under R. S. 4888 by speculation and deduction. A like argument was advanced in *Permutit* v. *Graver*. The argument was that because the patent described a stirer for the zeolites within the container, that this showed that a "free" as distinguished from a "locked" bed was disclosed, because as the Court of Appeals in that case said "this feature was necessarily presupposed"; and further, that the patentee need not describe nor understand "a certain theory of operation" of a structure in the specification and drawings. But this Court said (284 U. S. 59):

> "We think that these views rest upon misconception."

So here, in the Gulick original application the mere presence of a vertical split in the skirt, even if described as such, cannot be relied upon as disclosing "webs laterally flexible"—that "this feature was necessarily presupposed"

—certainly not when the original description was exactly the opposite, namely "an extremely rigid connection".

This Court further said (pp. 59-60):

> "But there is no suggestion on the drawing or elsewhere that the upper plate bearing the layer of sand or quartz has any purpose except to serve as a mechanical filter through which 'the water to be softened may be first filtered', or that the unoccupied space has any other purpose than that of similar spaces in sand filters long familiar."

So here, there is no suggestion in the drawing or elsewhere that the webs connecting the wrist pin bosses with the skirt had any other purpose than similar webs in pistons long familiar, namely, the webs of the Spillman and Mooers patent.*

The question is—what was the invention with which Gulick came into the Patent Office? Of course, the best answer is his description in his specification.

(3) Respondent says that one can follow the dimensions on the drawings of the Gulick patent and secure "webs laterally flexible", and that it is common for engineers to work from drawings. In the first place, this Court held in *Permutit* v. *Graver* that drawings cannot supply a deficiency in the specification. But, apart from that rule, this is not a case where the description in the original specification was silent and the drawing was one stated to be of actual dimen-

* The Master's finding 11 (R. 1098) is to this effect. See also his Report (R. 1155). This Spillman and Mooers patent was included in a suit against Sterling's customer, Simmons, resulting in a decree holding a piston like Exhibit 1 infringing this Spillman and Mooers patent, which Exhibit 1 was found by the Court of Appeals to infringe the Gulick and also the Maynard patent.

sions, so that those skilled in the art were told to follow the dimensions given. The drawings were conventional patent drawings which were not stated to be dimensional and which could not be legally considered as such. The specification did not even state whether the piston is to be of aluminum,* or of cast iron, or of steel,** although, these are different metals and require different dimensions. For that reason the drawings could not be relied upon where the specification is silent.

In order to show this Court the difference between a patent drawing giving no dimensions and an engineering drawing with its complete data, reference is first had to Plaintiff's Exhibit 21 (R. 1337). This is an actual engineering drawing of a piston, indeed probably the first engineering drawing of a piston of the Maynard patent. The first thing we see is dimensions in utmost detail with directions to take them at a "temperature of 70° Fahrenheit", and with the definite warning "NOTE—DO NOT SCALE THIS BLUE PRINT", which latter, of course, means do not pay any attention to the thicknesses and sizes delineated on the drawings, but strictly follow the dimensions indicated. Moreover, the nature of the material is given as "LYNITE" which is an aluminum alloy. Now in spite of all the pains that was taken in Exhibit 21, this piston apparently would not work, for no sale of a single piston has been shown (see discussion, petitioner's brief, pp. 40-41). We, therefore, next find Exhibit 22 (R. 1339) with a Keystone relief added at (H) with the notation "their wire". Here we find in addition

---

* Plaintiff's expert Dr. Jeffries admits that there is no disclosure in the Gulick patent, even as issued, that the piston is to be made of aluminum (R. 137).

** In 1917 pistons were made of cast iron (Schmiedeknecht R. 1306), and even of steel (Pugh R. 1744).

to the dimensions and warning given on Exhibit 21 also a specified "HARDNESS".

This should satisfy this Court that the drawing of the Gulick application was not a drawing on which any engineer would or could rely.

Respondents also contend that because the original Gulick application used the word "web" (even though originally described as "extremely rigid"), the application could be amended to describe the same web as "laterally flexible", because that was a "property" or something "inherent" in any "web". A dictionary definition of "web" (brief, p. 5) is given. What respondent has done was to quote the favorable and unanalogous definitions, and not the analogous ones which are the following, taken from a later edition of Webster's Universal Dictionary of 1937:

> "(d) the plate or its equivalent in a beam or girder which connects the upper and lower flat or laterally extending plates (fig. b); (e) the corresponding portion of a rail between the tread and foot (fig. e); (f) the flat portion of a wheel, as of a railway-carriage, between the nave and the rim, occupying the space where spokes would be in an ordinary wheel (fig. a); (h) that portion of an anvil which is of reduced size below the head; (j) the arm of a crank extending from the wrist to the shaft."

We are dealing here with a piston which is a machine structure analogous to a beam, rail or a crank, in which piston the web was described as "extremely rigid".

We have not here a web, but a piston having a web. Inherently such a web may be flexible, but again it may not be flexible under the forces permissible to prevent seizure of the piston in the cylinder. When it is therefore described as extremely rigid, it naturally means that it is rigid and

not flexible under the conditions to be ordinarily encountered.*

When, therefore, Gulick originally described the web of the piston as being "extremely rigid" those skilled in the art were told that it was to be made of such dimensions as to be rigid under the pressures permissibly active upon it in a cylinder. To so function it had a definite mode of operation by virtue of the rigidity of the web. When the specification was therefore amended to describe the web as "laterally flexible", there was introduced not only another structure, but another mode of operation.

This case, therefore, does not involve the disclosure of an element with an amendment describing the inherent property of that element as contended by respondents' counsel. The element originally described was not simply a "web", but "an extremely rigid" web, and by amendment this was

---

*The above explains the statements by both Jeffries and Stellman quoted in respondents' brief (p. 32). Both were considering inherent flexibility. Stellman was, of course, "looking at the drawings", but he had qualified his statement quoted by respondents' counsel by testifying (R. 568):

"Q. Anybody understanding pistons and skilled in the piston art would know those webs would be flexible if made of the material of which pistons are ordinarily made? A. Yes, if they were not tied down in any way as shown in this piston."

Furthermore on redirect he testified:

"Q. Is it your idea that the expression 'extremely rigid' means the same as 'very flexible'? A. I should not think so, no.

"Q. As a matter of fact, those expressions are as wide apart as the poles, aren't they? A. Diametrically opposed, I should say" (R. 577).

* * * * * * *

"A. He describes a very rigid section between the wrist pin bosses and the skirt of the piston, designated by 17 and 18 in Fig. 4.

"Q. Would that convey to your mind that the structure was intended to be very flexible? A. No, sir, I should say that he intended that it should be rigid" (R. 578).

changed to a "laterally flexible" web. They are not the same element, but are different elements, indeed, they are diametrically different in essential structure, function and mode of operation.

Respondents' brief, proceeding on the assumption that a patent is a contract, draws the rather ridiculous analogy that if there was a contract for a cow, it would not be necessary to specify that the cow was to have various vital organs. The difficulty with this argument is that a patent, although in certain respects a contract, must nevertheless contain "a written description of the" invention, and "of the manner and process of making, constructing, compounding, and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art or science to which it appertains, or with which it is most nearly connected, to make, construct, compound, and use the same" (§ 4888); and this Court has held that a deficiency of the specifications in any of the above respects may not be supplied by drawings (*Permutit* v. *Grover*).

(4) We have already shown how the decision in *Permutit* v. *Grover*, destroys the "inherent flexibility" argument, and, in our main brief, have pointed out that under that decision, the absence in the original specification of the element of lateral flexibility cannot be supplied by reference to the drawings on which respondents' expert relied. Respondents contend, however, that there is a difference between supplying an essential element of an invention which is missing in the specification of an issued patent and permitting an application to be thus amended in the Patent Office. We submit that there is no such difference when it is borne in mind that new matter can never be inserted in an appli-

cation.* As drawings may not be resorted to "where there is an entire absence of description of the alleged invention",** it was certainly new matter to insert in this application that the webs were laterally flexible, especially when they had been previously described as "extremely rigid". We have previously shown that the alleged "inherent flexibility" has no substantial basis. We submit, therefore, that it can make no difference, so far as the applicability of *Permutit* v. *Graver* is concerned, whether we are dealing with a pending application in the Patent Office or an issued patent.

Here as in *Powers-Kennedy* v. *Concrete Co.* the patentee lifted the finally claimed invention out of the application of the other man (Hartog). While Gulick was not in the Hartog-Pomeroy interference, respondent became familiar with the Hartog claim, as stated by respondent (R. 1875), and copied ("lifted") it (R. 1872). It is immaterial whether the Pomeroy application was then owned by Aluminum Company of America, although Jeffries shows that Pomeroy was then associated with that Company's predecessors (R. 185),

---

*The rule is stated by the Circuit Court of Appeals for the Eighth Circuit in *Insulite Co.* v. *Reserve Supply Co.*, 60 F. (2d) 433, 435, as follows:

> "While it is permissible during the prosecution of an application for a patent, to make amendments to the specifications and claims, yet these amendments must be directed to the same invention as originally disclosed, rather than to new matter".

In *Gardner* v. *Herz*, 118 U. S. 180, this Court held, to quote from the syllabus:

> "The suggestion in the second reissue, that 'the seat is adapted to be secured to any chair frame, as it is easily cut and fitted to the same', not being found in the original patent or in the first reissue, is new matter, and does not confer patentability on the article. No ground for patentability can be derived from the insertion of such matter in suggestions in the second reissue".

** *Permutit* v. *Graver*, 284 U. S. 60.

and it is a fact that the Pomeroy patent thereafter issued to respondent (R. 1803). Long was actively adverse from 1917 to at least April, 1924, when the trust estate was formed, after which, probably 1926, he stopped making pistons, as the trust estate then had the broad Spillman & Mooers and Franquist patents and had sued Long on the former (petitioner's brief, p. 7).

There were intervening rights of Long and Hartog, by the latter exactly as in the *Powers-Kennedy* case, where the MacMichael interests had purchased the Leake application, and both patents were issued to the MacMichael interests (see petitioners' brief, p. 25). The fact that petitioner was not involved is immaterial because in a situation involving adverse rights, the adverse rights of the general public are paramount, *Macbeth Evans Co.* v. *General Electric Co.*, 231 F. 183, 189 (Affd. 246 F. 695, C. C. A.—6), cited with approval by this Court in *Woodbridge* v. *United States*, 263 U. S. 50. Indeed it was really so held by this Court in the *Powers-Kennedy* case.

Respondents' counsel also says that no broadening took place, because claim 1 as filed was broader than what the Court of Appeals found was the invention of the Gulick patent.

Of course, if the flexible web was an essential element of the patent as the Circuit Court of Appeals held, it must be read into claim 1, for it is perfectly clear from the Court of Appeals decision that claim 1, without that element, would have been held invalid. It contains only the very elements which the Court of Appeals said would not involve invention over the prior art. But we are not concerned with whether there was a broadening of the invention or not. Rather the question is whether an essential element of a combination which the Court of Appeals held constituted patentable in-

vention was described in the original application in such a way that it could be *specifically* added, even when apparently contrary to the original disclosure, five years after another device containing all of the elements of the combination was on the market. *Powers-Kennedy* v. *Concrete*, and the cases which it followed, we submit, require a negative answer.

We are not concerned here with a broadening of any claim so as to include a piston having no web, because the Court of Appeals held that pistons which did not include any web, even though including a T-slot, did not infringe either the Gulick or the Maynard patents (R. 2394).

Point II.

Respondents attempt to answer our Point II by taking issue with our contention that the Court of Appeals found flexible webs an essential element of the Maynard patent. This respondents attempt to do by laying emphasis on the words "the regions of the wrist pin bosses". The language used by the Circuit Court of Appeals was "flexible webs in the region of the wrist pin bosses". This was but another way of saying "webs laterally flexible". The Court of Appeals said (the full quotation being on page 36 of our main brief) that the Maynard patent embodied the Gulick combination, one element of which was webs laterally flexible. Again it said:

> "It is clear that Maynard, while not departing from the teaching of Gulick in *basic combination of elements*, discloses a piston lighter and more economical of manufacture than Gulick and one more rugged and durable than Jardine" (R. 2393).

The invention over Gulick and Jardine was apparently found in *details* of construction, but one of the essential elements was the laterally flexible webs; necessarily so because of the prior Franquist, Schmiedeknecht and Long pistons (see our main brief). As these webs are neither described in the specifications nor mentioned in the claims, and can only be found by reference to the drawings or by reason of the "inherency" argument which we have discussed in connection with the Gulick patent, it follows that the Maynard patent is invalid under § 4888 in the light of *Permutit* v. *Graver*.

Petitioner's expert Stellman did not admit "extensive commercial use of the precise piston illustrated in the drawings of the Maynard patent" as stated by respondents (brief p. 49). He testified as to "general design" of such pistons, not the "precise piston". We have shown that no piston like Exhibit 1 was on the market that did not have the Keystone relief. Respondents' drawing of the Maynard patent piston (brief p. 52) does not show the Keystone relief and the Master found (R. 1162) that the Maynard patent did not disclose it in either the specification or the drawing, and this is based on the admission of respondents' expert Jeffries (R. pp. 130, 225). Indeed, the Keystone relief was not put on the piston until 1925, four years after Maynard filed (Exhibit 22, Vol. III, p. 1339).

Point III.

The Long pistons are belittled by respondents' counsel in spite of the fact that they were the only pistons compensating for expansion in commercial use before 1923 when the alleged piston of the Maynard patent is supposed to have first appeared. We do not have to rely upon any of

petitioners' evidence for this, because we have the testimony of respondents' own witness that they were in commercial use in the Franklin automobile as early as 1920 (see petitioner's brief, p. 45).

Not only were these pistons in use in the Franklin automobile, but they were in use in the replacement trade, in addition to Franklin automobiles in the Oldsmobile, Northway, Ford, Essex, Dusenberg and Reo (R. 392 and 412), and exhibits (R. 1613, 1615, 1617 and 1619). The Franklin engine was the worst possible engine that an aluminum piston could be used in, because it was air cooled, and Stellman shows that (R. 458). Furthermore, the Long piston was not replaced in 1926 by any piston of the Maynard patent, or even by Exhibit 1 having the Keystone relief, but by a strut piston (see petitioners' brief, p. 45).

What Should Be Remanded to the Court Below for Decision.

Respondents contend (Br. p. 77) that if this Court should reverse the Court of Appeals, it should remit to that Court for decision the questions arising upon the patents in suit other than Gulick and Maynard, as well as certain claims of the latter patents. If it is proper to remit to the Court of Appeals for decision the questions in respect to the patents not passed upon, even though the Court of Appeals apparently considered them of little worth (see our main brief, p. 4), we submit that respondents should not be afforded another opportunity to have the Court of Appeals pass upon other claims of the Gulick and Maynard patents than those specifically referred to in the mandate (R. p. 2379). In the first place, the Circuit Court of Appeals' holding as to what constituted invention in both

patents necessarily requires the reading into all of the claims of each patent "webs laterally flexible". In the second place, respondents picked out for the Court of Appeals certain example or typical claims for it to pass upon (see petitioners' brief in Court below, p. 74). *Great Northern Co.* v. *General Electric Signal Co.*, 57 F. (2d) 457, 461-462 (C. C. A. 8th, Cert. den. 283 U. S. 895).

Respectfully submitted,

THOMAS G. HAIGHT,
JOHN H. BRUNINGA,
JOHN H. SUTHERLAND,
Counsel for Petitioners.

vs.
THE CLEVELAND TRUST COMPANY,
CHRYSLER CORPORATION,
Respondents.
No. 676.

BRIEF OF RESPONDENTS ON THE PETITION FOR CERTIORARI.

It is manifest from the "Specification of Errors" (pp. 15 and 16 of the Petition) that the rule applicable in the instant case was stated by this Court in *Keller v. Adams-Campbell*, 264 U. S. 314, 319, 320, as follows:

> "Such an ordinary patent case, with the usual issues of invention, breadth of claims, and noninfringement,

this court will not bring here by certiorari unless it be necessary to reconcile decisions of circuit courts of appeal on the same patent. We therefore find ourselves mistaken in assuming that an important issue of general patent law under Sec. 4916, Rev. Stat. (Comp. Stat. Sec. 9461, 7 Fed. Stat. Anno. 2d ed. p. 211), is here involved. The result is that an order must be entered dismissing the writ of certiorari as improvidently granted, at the costs of the petitioner. *Layne & B. Corp. v. Western Well Works*, 261 U. S. 387, 67 L. ed. 712, 43 Sup. Ct. Rep. 422; *Furness, W. & Co. v. Yang-Tsze Inc. Asso.*, 242 U. S. 430, 61 L. ed. 409, 37 Sup. Ct. Rep. 141; *United States v. Rimer*, 220 U. S. 547, 55 L. ed. 578, 31 Sup. Ct. Rep. 596."

(1) The Decisions of the Courts of Appeals are in Harmony in the Instant Cause (92 Fed. (2) 330 (C. C. A. 6); 17 Fed. (2) 686 (C. A. D. C.); 47 Fed. (2) 365, 366, 367 (C. C. P. A.)): In the 17 Federal (2) and in the 47 Federal (2) cases all the lower tribunals were shown to be in accord with the appellate courts; little weight can be given the decision of the District Court in the instant cause because, the Court of Appeals said that to do so "may prove to be an unsafe guide to just decision where exceptions to a Master's report are unilluminated by oral argument and a decree entered without elucidation of the reasons upon which it is based." (R. p. 2389.) Where the Master differed from these appellate Courts, the differences were differences in law. It is extremely doubtful whether it is correct to say that the Master is in discord with all of these other Courts since his holding was not that Gulick had broadened his disclosure, but only that he had made an "attempt" to do so; all the other tribunals—except, of course, the District Judge—have held that Gulick had not broadened his disclosure. Unless, therefore, this finding of the Master of an "attempt" to do something be construed to be the doing of that thing, the Master and the District Judge are not in discord with the three Courts of Appeals.

(2) No Public Interest: There is even less public interest in the instant cause than in the ordinary patent infringement cause such as *Keller v. Adams, supra*, or any number of other patent causes certiorari in which are denied monthly.

Of the seven devices charged to infringe, but one was specifically held by the Court of Appeals to infringe. In other proceedings Petitioners contend that the Court of Appeals held that the other six did not infringe. Three licenses have been granted under the patents in suit and the three licensees have always been and are prepared to supply all the public's needs for the patented pistons at reasonable prices. Many other kinds and types of pistons are available to the public; some of these were never patented and on many others the patents have expired. Among these are the Franquist and Spillman, *et al.* patents which Petitioners praise so highly and to which Petitioners attach so much importance. Many motor makers, such as The Ford Motor Company and General Motors Corporation, are using non-infringing pistons in many of their cars.

The alleged public interest urged by Sterling Products Corporation, here in the stead of the Petitioners, is no more than a desire of Sterling to be permitted to continue to duplicate, even to their most minute details, the various piston structures patented by Respondent, just as Sterling has been duplicating such structures from time to time in the past as they have been invented, patented and marketed by Respondent and its licensees. (R. pp. 84, 129, 130 and 1327.)

Alleged Pooling of Patents: As in this Court, the Petitioners in the Court of Appeals pressed, with many repetitions, its claim of "patent pool," but the Court of Appeals said no more than that the Respondent "is the

repository of numerous patent rights assigned to it by inventors" and others (R. p. 2383); it is not, therefore, a patent pool even to the extent of the grouping of patents found *legal* by this Court in the *Oil Cracking* case, 283 U. S. 163. Owing to the numerous defenses that may be interposed in a patent suit—such as was done here (R. p. 2384)—and to the need of references to Masters due to overworked District Judges, individual inventors cannot meet the expenses of such records as that of the instant suit. Hence, they have united their interests, just as others such as workingmen, stockholders, etc. are doing to meet modern conditions; that is all that has been done here and it is for, and not against, public policy, since it provides inventors a way to realize remedies which the public intended they should have and of which they would, otherwise, be deprived by the longer purse of the infringers.

The issue of "patent pooling" is not raised by the pleadings here, and is not an issue that can be raised in a patent infringement suit. (*Trico v. E. A. Laboratories*, 49 Fed. (2) 404, 405; *Andrea, Inc. v. Radio*, 14 Fed. Sup. 226.) If the Petitioner is aggrieved, the Anti-Trust Laws provide him with a way of asking for relief either by going to the Courts or inducing the Department of Justice to do so. The Department of Justice is now investigating the Respondent's "repository of patents" and, if any wrong has been done no doubt the issue of "pooling" will be dealt with before the proper tribunals, in the proper manner and on issues properly made, etc. It would seem that reliance could be placed upon the Department of Justice to deal with the question of pooling, if there is any such question here. Manifestly, that question is presented here for no other reason than a hope that the Court may be led into considering an issue not before the Court.

For the same reason, frequent reference is made to the Aluminum Company of America, who is one of the

licensees under the patents in suit; counsel drag in the most immaterial and remote matters such as the Pomeroy interference* in order to drag in the name of the Aluminum Company. We note from the public press and from reported Court decisions, that the Aluminum Company is being investigated by the Department of Justice, and that should suffice.

(3) Litigation in a Single Circuit: Respondent instituted a suit on the patents here involved in Brooklyn, New York, in the Second Circuit, to get an adjudication in another Circuit than the Sixth Circuit on a piston made by the E. M. Smith Corporation of Los Angeles, California, but Sterling Products Corporation of St. Louis, Missouri, who is conducting the proceedings in the instant suit, connived to have that suit go by default; Sterling also left the Eighth Circuit and came into the Sixth Circuit to submit to the jurisdiction of the Courts here, so that Petitioners can hardly complain if the pending litigation is confined to the Sixth Circuit, since they, and not Respondent, are responsible therefor.

Most of the pistons are made and sold by others than motor manufacturers, so that it is unimportant that most of the motor makers are located in the Sixth Circuit.

The Petitioners duplicated the piston shown in the drawing of the Maynard patent, as others have done in other Circuits than the Sixth, but there has been no time to institute suit against any of these since the mandate came down in the instant causes and no need to do so, until it can be determined whether such infringements will cease without suit. We assume that we may, and should properly, await the termination of a test case in one Cir-

---

* The Aluminum Company had nothing to do with this interference; it was fought and terminated before the Aluminum Company bought the Pomeroy application.

cuit before we proceed to duplicate litigation in other Circuits; likewise, that we may withhold litigation until others have had reasonable time to conform to the rulings of the Court of Appeals in the Sixth Circuit. Moreover, we do not have here a case where the only ruling upon the matter urged is, and always must be, the ruling of one Court of Appeals, since, as we have said, two Courts of Appeals other than the Sixth Circuit Court of Appeals have each decided in favor of the Respondent on the only "error," which Petitioners claim the Court of Appeals made which could be controlling.

The "Specification of Errors" are four in number. The only one which is urged as controlling is the first. The second and third relate to cumulative matters only and the fourth is formal.

The "First Specification of Error" relied upon for the petition, and the specific error said to have been committed by the three Appellate Courts, and all the tribunals lower to two of them, is an error of law and in fact.

The Law Phase: It is true that a patentee is required to disclose in his patent and in his claim *the elements* of his machine—where his invention is a machine—but it is equally true that he is not required *to describe all the properties of those elements.* (*Eames v. Andrews,* 122 U. S. 40, 56.) When Gulick and Maynard described the *webs* in their specifications that was all that was required of them; they were not required to describe the properties of the webs such as flexibility, hardness, high coefficient of melting point, durability, resiliency, and all the other properties of piston metals. Manifestly, to include in a patent disclosure a description of all properties of all elements and of all the materials of which they are made would make patent claims

and descriptions endless. This Court did not, in *Permutit v. Graver,* in *Powers-Kennedy v. Concrete,* or in any other decision, so hold; neither has any other Court in any other decision so held. The law is, and must needs be, to the contrary; the contrary is the rule in this Court and in all the Circuits (*Eames v. Andrews, supra*; *Diamond v. Consolidated,* 220 U. S. 428, 436; *Jackson v. Peerless,* 228 Fed. 691, 693 (C. C. A. 6); *U. S. Ozone v. U. S. Ozone,* 62 Fed. (2) 881, 890 (C. C. A. 7); *Hoskins v. G. E.,* 212 Fed. 422, 430, affirmed 224 Fed. 464 (C. C. A. 7); *Mead-Morrison v. Exter Mach.,* 225 Fed. 489, 496 (C. C. A. 3; *Novedel v. Meyer,* 35 Fed. (2) 697, 703 (C. C. A. 2); *National v. Interchangeable,* 106 Fed. 693 (C. C. A. 8).

Typical of the statements of these rules is that by Judge Sanborn, speaking for the Eighth Circuit Court of Appeals in *National v. Interchangeable,* and occurring at 106 Fed. 709:

> "It is true that Hein did not describe or claim, and it is possible that he was not aware of, the utility of *resilience in the beam* when he procured his first patent; but the law did not exact of him a statement or claim of the functions or uses of his combination,"

If counsel were correct, innumerable patents would be invalid on their face for few have ever so extended the description.

These properties are known to those skilled in the art to whom patents are addressed. Description in specification and claims, without naming all their properties, is sufficient to teach those skilled in the art and therefore is sufficient disclosure.

Moreover, if counsel were correct in their contention, or in their contention for what this Court meant in *Permutit v. Graver,* very commonly prior art, and especially that based upon public invention, public use, or the like, would be insufficient, since often there is no description at all of

such prior art except such as is found in models and drawings, and even where there are elaborate descriptions, the engineers or mechanics making such description seldom describe the properties of the materials of which prior art devices are made.

The expert for the Petitioners, as well as for the Respondent, testified that the webs would be flexible and anybody would know that they would be. Petitioners' expert said (R. p. 568):

> "That is, with your knowledge of the piston industry you would know by looking at the drawings (Gulick patent) that those webs would be flexible if the piston was made of material of which you ordinarily made pistons? A. Yes."

Respondent's expert testified (R. p. 201):

> "Q. Do you know of any metal of which internal combustion engine pistons are made or have been made which, employed in the construction of the piston illustrated in the drawings of the Gulick patent, would have webs that weren't flexible? A. No.
>
> "Q. State whether or not it would be possible in your opinion to make a piston out of any metal employed for making internal combustion engine pistons and conforming to the drawings of the Gulick patent, without having flexible webs? A. No, it would not be."

* * * * *

At Record page 150 he testified of Gulick:

> "Q. Oh, yes. A. Well, then, it is clear enough what he had in mind. These drawings are susceptible of no other interpretation, as I see it. 'You have got longitudinal rigidity and lateral flexibility.'"

(See also R. pp. 173 and 1006.*)

---

* Thus counsel's repeated statement that Respondent's "expert testified that flexibility was not inherent in the web structure" (Petition, p. 19) is flatly contrary to the record and the evidence of both experts.

(Continued on page 9.)

In the *Permutit v. Graver* case, a filtering device was involved which included a filter bed composed of a plurality of grains of zeolite, or like material. The point of novelty of the apparatus consisted in providing a bed with a space above it and (for cleaning) such a current flowing up through it that these grains would be driven upward from the bed by the current, spread out by the current, and then allowed by such current to return to the bed in such a way that they would settle down in a new and different arrangement so as to rejuvinate the filter bed. As this Court said (284 U. S. 56) it was "necessary to have an open space above the top of the zeolites in order to furnish opportunity for the zeolites to rise or boil and to spread out

---

The petition and briefs thereon are full of half statements and deductions, found erroneous when the record is carefully considered. Such are those in the footnote at the bottom of page 6 of the petition, for example, each of which is contrary to the above statements and to common knowledge. We cannot undertake to correct all of these misstatements and half statements, but will answer those at the bottom of page 6 of the Petition.

At page 229 of the record our expert said, in discussing the pistons including the Ricardo piston, that the flexibility of the web could not be depended upon. This is because the web of the Ricardo piston is so bound by other members that it cannot flex (R. p. 1718). That he was not talking about the Gulick, but was about the Ricardo, is clear from the following question and answer on page 228:

> "Q. And the distinction between the Ricardo piston and the Gulick piston is, again, that the Gulick webs are flexible and Ricardo's weren't made that way for flexibility; is that right? A. That is one of the distinctions; of course there are others."

His testimony at pages 149 and 150 was that Gulick "does have a rigid piston longitudinally, and a flexible piston laterally" which is what Gulick originally described. One of the difficulties encountered was the production of a piston which would be rigid vertically but flexible horizontally; that Gulick did and that he did describe in his original specification. Petitioners, as did those before the tribunals and Courts, undertook to change this description around and make it read rigid horizontally, without success in any of the three Courts of Appeals.

(Continued on page 10.)

and reform in the bed." Much more was necessary than a mere free space above the bed. This space had to cooperate with the currents which caused the grains to rise, mixed them up and permitted them to return in a new arrangement to the bed. This Court said (p. 59) "there is no suggestion *on the drawing or elsewhere*" of this operation and function. The most the claims recited in that connection was "a filter bed." Thus the feature which included structure, operation and results was not suggested in the *drawing, in the specification or in the claims* and, of course, the patent (of which this feature alone was new) was invalid for want of disclosure. Such a situation is a far cry from the one involved in the instant case where the web, its operations and what it does are all described and have always

---

At page 154 our expert testified that the webs could be made non-flexing "if they are made one inch thick," but if you did "you haven't a practical piston at all." By leaving out these qualifications we assume the Petitioner hoped to have this Court believe that the witness was referring to the pistons of the patents in suit concerning which both experts had testified to the contrary, as we have quoted above.

The witness did not say that it was necessary to deliberately design the webs of Gulick to secure flexibility (at either page 156 or page 229 of the record). What he said was that these webs would be flexible in any event, but that deliberate design would, in considering different piston designs, secure the desired flexibility for any particular design but that in any event "*It happens, or it is a fact that the Gulick construction appears to flex a proper amount*" (R. p. 156). We have already pointed out that by the reference at page 229 it was the Ricardo piston and not the Gulick piston which the witness said, in distinguishing therefrom, had flexible webs.

Another one of these half statements, that is fertile with misguidance, occurs in the first footnote at the bottom of page 20 of the Petition. The reference to page 122 of the record there given shows that Dr. Jeffries testified that there were features other than the web which combined with the webs to compensate for the expansion at the top of the Maynard piston and that enough was present "to make the difference practically between success and failure of the piston." He did not say, as counsel contend on the basis of the testimony, that web flexibility was the difference between failure and success.

been described and illustrated in the patents. The complaint is that the patentees did not mention a property, i.e., flexibility of the webs which were known and understood and which both experts say was inherent in the material of the webs. It has always been the law that where a party did not suggest a thing in the drawing, the specification or the claims, the disclosure is insufficient. No new rule of law was made by this Court in *Permutit v. Graver*. It has likewise always been the law that a patentee is not required to describe all of the properties of the materials of which his elements are made. There is not only no conflict between the two rules, but no relation between them.

In *Permutit v. Graver*, the overruled decision of the Circuit Court of Appeals had found, in the drawings, a sufficient disclosure of the unstated "free and unconfined" space above the filter bed by reference to another part of the drawing, the stirrer, which, if operated as described, indicated the free and unconfined character of the top of the filter bed. This Court held that this was going too far in finding disclosure by a drawing. In the drawing of the filter bed itself, there was nothing to show that the top was free and unconfined; there might have been, as there had been in the earlier art, a close fitting cover perforated sufficiently for percolation but an obstruction to boiling up under a current from below.

In other words, the "free and unconfined" character of the top of the filter bed was not inherent in the filter bed structure shown by the drawing and in the operation of that structure as described in the specification, as the flexibility quality was in the Gulick structure as shown and described; but in the *Permutit* case this quality, instead of being inherent in the filter bed shown in the drawing, was to be inferred from the supposed operation of some other part of the structure shown in another part of the drawing.

Petitioners' contention for the interpretation of this Court's decision in *Permutit v. Graver* is not only contrary to the plain language of that decision but, if accepted, would place that decision contrary to the statutes, the practice for more than one hundred years and plain common sense. Although it is a moot question here, the statute requires a single and not a double disclosure. It is common knowledge that engineers and others skilled in the arts, including that to which pistons relate, make their disclosures through drawings hundreds of times where they make disclosures through descriptions once. The drawings are clearer and more accurate in describing than words are or can ever be; the drawings can be understood more quickly than the words; they are also less ambiguous than the words. For anybody to say that these drawings do not disclose the devices depicted in them to those skilled in the art is to say what is not true, because they do, to common knowledge.

If the rule were as Petitioners contend this Court said it was in *Permutit v. Graver*, then much of the prior art which is cited and relied upon in this case and has been relied upon in other cases, often to invalidate patents, would be impertinent, because it is rare that cases of prior invention, prior use, or the like, are established by any other descriptive matter than drawings or models. In better words, it is very rare indeed to find a contemporaneous written description of a prior device, except where it is patented or described in a printed publication, and then one never finds a description so complete as to recite all of the known properties of the elements and the materials employed, as Petitioners say was necessary under this Court's holding in *Permutit v. Graver*.

Nor is there any such conflict between the decisions in the Sixth Circuit Court of Appeals and in the other Circuits as counsel state on page 9 of the Petition. In the two Sixth Circuit cases cited, the Sixth Circuit Court of Ap-

peals said that it did not understand that the general and ancient rule that resort may be had to the drawings and specifications to interpret the claims was affected by this Court's decision in *Permutit v. Graver* and, of course, it was not. This rule is older than the patent law and comes from the rule that where the terms of a contract are ambiguous, resort might be had to collateral matter to clear up the ambiguity. Certainly, if drawings were available which did clear up such ambiguities, they would be available under the general rule. Petitioner's contention that all of this has been changed by this Court's decision in *Permutit v. Graver* is manifestly unsound.

In the cases from the other Circuits which counsel has cited and sought to place in opposition to the decisions in the Sixth Circuit Court of Appeals, the Courts in the other Circuits were merely following the well established rule that where there was insufficiency of disclosure, such as was the case in *Permutit v. Graver,* the patents were invalid for that reason.

Counsel cite too many such cases for us to analyze each one of them; counsel quote from one only of them, i.e., *Helfrich v. Solo,* 59 Fed. (2) 525 (C. C. A. 7). The matter quoted means nothing. The facts mean much. The patent related to a composition of matter used for a face powder. Various ingredients are listed at pages 526 and 527. The invention was bottomed on the ratio of the ingredients and, as the Court said, "*concerning that ratio the patent disclosed no information.*" Moreover, not only was the ratio not within the skill of the art but, as the Court said "no amount of skill or art in following patentee's specification would produce," except accidentally, the result sought. The patentee appreciated this and tried to supply the omitted information regarding the ratio by oral evidence which, of course, the Court said could not be done.

We have carefully combed the reported decisions citing *Permutit v. Graver*, including those referred to by Petitioners; we find that no Court has ever interpreted *Permutit v. Graver* as requiring a patentee to describe a known property of an element or the material of an element employed in his combination; no Court has interpreted this Court's decision as requiring a patentee to describe a property inherent in an element which he did describe. A true and intelligent discussion and application of the rule applied in *Permutit v. Graver* is found in an opinion of the Sixth Circuit Court of Appeals (*Waukesha v. Willys-Overland*, 77 Fed. (2) 906, 909) *by Judge Simons who wrote the opinion in the instant cases, sitting with the same Court as sat in the instant cases* (Hicks, Simons and Allen, *JJ.*).

The Fact Phase: Counsel are just as much in error in their facts as they are at sea in their interpretation of the law. While it is true that the term "flexible" was not used in the written descriptions, other terms were used which mean the same thing. The rose, however, is the rose notwithstanding the name. We can best point out counsel's errors and support our statements by quoting from the opinions of the Courts of Appeals who ruled specifically upon this point.

The following from the decision of the Court of Appeals in the District of Columbia (17 Fed. (2) 686) we think is typical of the application of the facts in the instant case to the law:

> "The drawings of Gulick, we think, clearly disclose the structure of the count. It is contended, however, that his structure is not such as will 'permit free expansion and contraction of the skirt portion.' But the claim expressly covers this objection in the following language: 'Said skirt being split from top to bottom on one side only of the pin bosses to permit free expan-

sion and contraction of the skirt portion.' We think it clear that the object of the split is to permit of this expansion, and, as held by the Board of Examiners, 'under the action of the heat, the circumferental expansion of the skirt would necessarily flex the webs sufficiently to permit the expansion without substantial increase of the diameter of the skirt.' "

The Court of Customs and Patent Appeals concurred in this view (47 Fed. (2) 366-367):

"The main contention of appellant, and the chief subject-matter in controversy in this long and hotly contested interference, is that Gulick's structure does not contain in it means for joining the cylinder engaging parts a resilent yieldability. On this question the tribunals of the Patent Office concur in holding that Gulick's disclosure does show such resilient yieldability and that he can make the claim.

"This part of the issue in this case was before the Patent Office tribunals in an interference case between Gulick and Long. Long contended that Gulick's construction was rigid and could not operate to permit free expansion and contraction of the skirt portion. The Law Examiner held that 'the flanges or ribs 17 and 18 must allow such expansion and it is not material for the present purpose whether they move about one end or are slightly flexed laterally. * * *.' Upon appeal to the Examiners in Chief they said: 'If the webs 17, 18 were so rigid that they would not yield laterally, the slot would have no function.' Upon appeal to the Commissioner, he said: 'The material of which both types of pistons are made will readily yield to the small extent required to bring the piston skirt to the proper diameter. * * *.' Then upon appeal to the Court of Appeals of the District of Columbia, Mr. Justice Van Orsdel, speaking for the court, said: 'We think it clear that the object of the split is to permit of this expansion' and that Gulick had the right to make the claim 'beyond question.' *Long v. Gulick*, 57 App. D. C. 98, 17 F. (2d) 686, 687. The claim there at issue, while somewhat different from the count at bar, called for

a split skirt 'to permit free expansion and contraction of the skirt portion.'

* * * * *

"We conclude that Gulick has the right to make the claim."

The contention that the rule followed by the appellate Courts in the above quotations had been revoked or left stranded by this Court's decision in *Permutit v. Graver* was urged upon the Sixth Circuit Court of Appeals with the same fervor that it is urged upon this Court here. Therefore, in adhering to the decisions of the other appellate Courts, the Sixth Circuit Court of Appeals must have fully considered such contentions and rejected them. (R. pp. 2385 and 2391.)

Counsel are likewise confused about this Court's opinion in *Powers Kennedy v. Concrete*, 282 U. S. 175. In that case the patented invention of McMichael was antedated by Leake as the Court said at the top of page 184. The question of identity between McMichael's device and that of the antedating Leake's device was the question discussed by the Court. Mr. Justice Roberts, who wrote the opinion of the Court, finally cited as conclusive proof of identity the fact that McMichael had copied Leake's claims, with the justifiable inference that such copying was an admission of identity. It was for that purpose that the learned Justice made the statement quoted at the bottom and the top of pages 12 and 13, respectively, of the Petition. It is plain that no such interpretation was intended to be given to the language as counsel here seek.*

---

* It thus becomes clear that the statement at the middle of page 20 of plaintiff's brief regarding the *Powers Kennedy Case* is erroneous. This Court's statement that "This of itself destroys the patent" refers to the admission of identity between the patented invention and the device of the prior art and not to the fact that claims were added. The right of an applicant to amend and add claims is established by authority ancient and current.

Assuming that patent claims may be held invalid when there is a broadening of the claim in the face of adverse intervening rights, such a situation does not exist in the case at bar, first, because there was no broadening of the subject matter claimed since Claim 1 of Gulick was presented in the original application as it now appears in the patent and, second, because intervening rights are not sufficient since such rights must be adverse as well as intervening. The only rights recognized as such in the premises** that intervened in the instant case were those of the plaintiff's licensees and no Court has ever held that a patentee has forfeited any of his privileges under a patent because of the "intervening rights" of those operating under him.

At page 19 of the Petition counsel state their position on the first specification of errors as follows:

> "While, at the time the question was presented to the tribunals of the Patent Office and the administrative courts, it was the practice of the Patent Office to permit amendments describing a supposed 'inherent' mode of operation or characteristic of a structure shown only in the drawings of a patent application, that practice was unqualifiedly overthrown by this Court's decision in *Permutit v. Graver, supra.*"

It would not matter if it had been the rule in the Patent Office, prior to *Permutit v. Graver,* that a description in a patent specification might be amended to describe characteristics of a structure said to be inherent in the drawing of the patent application, which was not hitherto described in the descriptive part of the specification, for no such thing was done in connection with the Gulick application. What was done there was to merely amplify and state in other words matter which was already described in the specification as well as illustrated in the

---

** —paper rights have never been so recognized—

drawings. The purpose of this amplification was to make clear to those unskilled in the art what was already clear to those skilled in the art. The following language on this subject appeared in the original Gulick specification (R. pp. 1837-1839):

> "One of the objects of the present invention is to provide a piston which is not adapted to expand against the cylinder wall to such an extent as to seize or stick.
>
> "Another object of the invention is to provide a piston with a skirt slightly separated from the head of the piston and split longitudinally so that it will not expand in circumference with a force great enough to cause the piston to stick in the cylinder.
>
> * * * * * *
>
> "In order that the skirt may not expand an undue amount when the piston is heated, as under operating conditions, it is split longitudinally as at 21.
>
> * * * * * *
>
> "It will be seen that in addition to providing a piston with a split skirt, the above described construction also provides an extremely rigid connection between the piston pin bosses and the skirt of the piston * * *."

There could have been no doubt in the minds of anyone skilled in the art who is familiar with piston constructions that the reference to the rigid connection was a reference to the vertical rigidity of the piston which is a characteristic as important as the lateral flexibility, and that the reference to the expansion to the cylinder wall without sticking or seizing was a description of the property of transverse yieldability only. These conclusions follow from several considerations. First, the use of the term "in addition," appearing in the last above quoted paragraph, distinguishes the previous description of the transverse operation from the description of the feature to follow, i.e., the

vertical feature which is said to be "extremely rigid"; second, the use of the word "also" in the same paragraph likewise divides the discussion of the transverse operation from the vertical and distinguishes the two; third, if the term "rigid" were used to mean the vertical, it would respond to the description and the known features of the piston whereas, if it were applied to the piston transversely, the piston would seize and stick and, therefore, fly in the face of the other portions of the description. Counsel offer no proof that this language was not a disclosure to those skilled in the art of vertical rigidity and transverse flexibility. All of those skilled in the art who have discussed this subject, including the many judicial and administrative tribunals to which the Patent Office refers, found that it was a disclosure to those skilled in the art of transverse flexibility and vertical rigidity. We are, therefore, not here confronted either with any such rule as counsel say was current in the Patent Office prior to *Permutit v. Graver* or to any such rule as counsel say was made by *Permutit v. Graver*, but with the rule that a patentee may, during the prosecution of his application, amplify matter contained in the description so that it will be clearer to those skilled in the art and clear to those unskilled, as well. Such has always been the rule in this and other Courts. See *Michigan v. Sutherland*, 29 Fed. (2) 179, 184 where the rule is stated and authorities following the same, including opinions of this Court, are collected and cited by Judge Knappen speaking for the Sixth Circuit Court of Appeals.

The "Second Specification of Errors" presented by the Petition (p. 16) complains that the finding of commercial success by the Court of Appeals was based on the royalties paid the plaintiff by its licensees under its patents. This is incorrect and would be immaterial if correct. The basis

upon which the Court of Appeals found commercial success in the instant case is stated by that Court at page 2388 of the record. After investigating and eliminating all other possible explanations except the merit of the invention, for the wide adoption and use of the patented pistons, the Court concluded that no other alternative inference could be drawn than that the commercial success was due to such inventions and, further, that such was confirmed by the fact that the patented pistons has been adopted only after exhaustive tests by skilled and disinterested engineers working in an industry, which was meticulous and skeptical about the acceptance of new devices, no matter how enticing they appeared from theoretical considerations.

However, before coming to the consideration of commercial success the Court of Appeals had found invention, based upon long and unsuccessful searches for a solution of the problem by those most skilled in the art and the like. (R. pp. 2387-2388.) Such findings alone are sufficient to support the finding of invention (*Expanded Metal* case, 214 U. S. 366; *Temco v. Apco*, 275 U. S. 319). The finding of commercial success was at most, therefore, merely contributory to the finding of invention. It is apparent that invention would have been found in view of the prior efforts and failures to which we have referred even without the further commercial success indicated by the sums of royalties paid. However, as is apparent from the Court's decision, the payment of the royalties, which is ordinarily considered evidence of commercial success, was viewed by the Court of Appeals as so much less important than the other grounds discussed by the Court that the royalties were not even mentioned.

Counsel thus attack the finding of the Court of Appeals on the presumption that such finding was based on the only pertinent evidence on which it was not based.

We think the findings of the Court of Appeals also answer the contention that the success of aluminum pistons was due to such things as the "strength of the hands into which the patent came" and likewise to the contention that it was due to other inventions or to expired patents.

In view of the clear discussion and finding of the Court of Appeals we will content ourselves with denying the allegation that the success of the pistons was attributed by us or our expert to other inventions or other patents. It would lengthen this brief unduly to prove the inaccuracy of all of the erroneous statements in the petition. We think it also clear from the discussion of the Court of Appeals that the licenses were taken because of the merits of the inventions and not because of cross licenses.

The finding of the Court of Appeals that the commercial success was attributable to the patents in suit and not to other patents owned by the plaintiff is based upon the record and the evidence of the witnesses including that of the defendant's own expert who testified that the very identical pistons shown in the Maynard patent were made, sold and used in large quantities. (R. pp. 462, 471 and 955.)

The "Third Specification of Errors" relates to the views of the Court of Appeals upon the presumption of validity of a patent which are as follows (R. p. 2388):

> "So also with respect to the presumption that attaches to the validity of a grant by the Patent Office. Where, as in this case, substantially all pertinent prior art has been cited against the patent, where in hard fought interferences novelty and invention have been challenged, and where priority of conception has been finally adjudicated only upon repeated review in both administrative and judicial forums, the patent should not be stricken down except upon very clear and convincing proof of invalidity."

It is stated that these views are wrong where the rule relied upon by the Patent Office and the earlier cases has been reversed by a later decision of this Court. The above finding by the Court of Appeals is in harmony with this Court's decision in *Radio v. Radio* which is later than the decisions of the administrative and judicial tribunals by which the Court of Appeals found the presumption to be strengthened. We know of no later decision of the Court of Appeals which overcomes the rules relating to presumption of validity expressed by the Court of Appeals and by this Court in *Radio v. Radio.* If counsel mean to repeat their erroneous contentions regarding the finding of this Court in *Permutit v. Graver,* our answer is to be found in our discussion of this decision. We may add, however, that in view of the presumption of validity which arises from all of these decisions, including that of this Court in *Radio v. Radio,* if and when any doubts arise as to the proper interpretation of this Court's decision in *Permutit v. Graver,* they should be resolved in favor of the validity of the patent for the reasons we have stated.

The "Fourth Specification of Error" is merely formal and needs no discussion by us except to say that the Court of Appeals made no error.

The Standing of the Master's Report: Under this heading counsel rely upon the often quoted expression from the opinion of Mr. Justice Holmes in *Adamson v. Gilliland,* i.e., that (under certain circumstances) the Master's report should be "treated as unassailable." Doubtless this expression has led to some confusion in some of the lower courts. Perhaps it should not have done so; but there is no occasion for this discussion here because we take it to be generally understood that for the very purpose of put-

ting an end to such confusion this Court adopted General Equity Rule 61½. Since the adoption of that rule there is obviously no force in contending that the Master's report has any effect excepting that which is carefully stated in that rule. The Circuit Court of Appeals for the Sixth Circuit has always adhered to that view of the Master's report which this Court, by the adoption of Rule 61½, made obligatory upon all the lower courts.

In the instant case, the only theory upon which petitioners appeal to *Adamson v. Gilliland* is that the Master failed to find commercial success. "This evidence failed to convince the Master that any of the patents in suit were commercially successful * * * sufficient to justify his refusal to accredit the patents in suit with commercial success." (Pet. p. 21.) In this respect there is not a scintilla of evidence to support the Master's conclusion. All of the witnesses testifying on the subject, including the defendant's own expert, testified not only that the patented pistons were successful, but that the identical form illustrated in the Maynard patent had gone into wide use. (R. pp. 462, 471, 955.)

Overlapping Patents: Much is said in the brief about overlapping patents and a diagram is arranged on page 5 to support this contention. People often lose sight of the fact that it is the very purpose of the Constitution and the patent laws to encourage the making of inventions and become alarmed when they find that the result aimed at by the Constitution and the patent laws has been achieved. In this achievement it is inevitable that devices originally invented will be improved upon and that the improvements will often be made before the patents upon the original inventions have expired. Thus overlapping patents have become one of the inevitable concomitants of the Constitution

and the patent laws; in fact, such a result was in contemplation and one of the purposes of such rules and laws. This Court has had occasion to recognize and commend such a result (*Eibel Process* case, 261 U. S. 45, 63). Counsel's discussion on this subject, as might be truly said of all their discussions, is a challenge to the wisdom and propriety of the provisions in the Constitution about rewards for inventions and the patent laws. Their complaint, in fact, is that inventions should not be made and patents should not be taken out on them. If such were the rules Petitioner and Sterling would have no pistons to make, for up to date the only pistons they have made have been duplications of those made by the complainant's licensees.

Conclusion: It follows that the only alleged error of the Court of Appeals, which is other than cumulative or a determination of which could be more than a declaratory ruling, is the claim of the insufficient disclosure in the Gulick original application and the propriety of the clarification thereof. Three Appellate Courts and numerous other tribunals have held contrary to Petitioners' contention on that point.

In an attempt to find some mote of dissent from these numerous concording views, counsel grasp at and rely upon the Master's statement that there was "an attempt" to do what all these other tribunals found had not been done. Since this finding of "an attempt" cannot be construed to be a finding of a doing, there is difficulty in finding even a mote of dissent.

Hence, the Petition is no more than a request for a review of the concurring decisions of all the Appellate Courts ruling thereon, and beyond that a request for a review of rulings of the Court of Appeals which counsel claim are erroneous and which would be merely declaratory if brought here and reviewed.

Neither rule of, nor precedent in, this Court is authority for certiorari on such a showing.

We think the Petition should be denied.

Respectfully submitted,

A. C. DENISON,
F. O. RICHEY,
WM. C. MCCOY,
Counsel and Solicitors for Respondents.

INDEX.

Foreword to This Brief 2

SECTION I.—THE QUESTIONS PRESENTED BY THE PETITION 5

Petitioners' "Reason" Number One 5

Web Flexibility—in the Abstract 5

Web Flexibility as an Element 7

The Court of Appeals Did Not Say that a Web that Was Flexible Was an Essential Element of the Patented Pistons 8

Flexibility, Original and Inherent, as Adjudicated by the Technical Tribunals 9

vs.

THE CLEVELAND TRUST COMPANY,
CHRYSLER CORPORATION,
Respondents.

RESPONDENTS' BRIEF.

PETITIONERS' STATEMENT OF THE CASE.

This Statement (Pet. Bf. pp. 2-14), we insist, is inaccurate and misleading in many particulars. In the interest of brevity, we pass by any introductory summary of these errors, and point out the important ones hereafter in connection with its specific subject matter.

FOREWORD TO THIS BRIEF.*

We agree with the statement on page 17 of petitioner's brief that "This Court will not consider any question other than those upon which the petition for certiorari was based." The petition for certiorari (pp. 8-11) shows three, and only three, "reasons relied upon for the allowance of the writ." They are: (1) that an essential element of the patented combination was not described in the application as filed, but was later inserted without sufficient justification and in disregard of *Permutit v. Graver* and *Powers-Kennedy v. Concrete*; (2) that an unidentified fact decision of the Master was overruled, inconsistently with *Adamson v. Gilliland*; and (3) that the decisions of the patent office tribunals should not have been followed (pursuant to *Radio Corporation v. Radio Laboratories*) because the legal basis of those decisions was inconsistent with the later opinion of this Court in *Permutit v. Graver*.

The specification of errors (pp. 15-16) repeats, in other words, the same three complaints, adding only a general allegation of error, too vague to be effective.

We do not understand that, in such a situation, extended recitals in the statement of facts, which might argumentatively suggest additional complaints, can avail to broaden the specific "reasons" in which the petition culminates.

Petitioners' brief wanders far from these three points and discusses many other matters. Among these matters which should be thus excluded from present consideration are:

---

*Throughout this brief, the emphasis found in any quotation is added by us.

(1) *That the Gulick and Maynard patents are invalid because not involving invention over the prior art.* We cannot suppose that the Court intended to bring up for decision any such broad question of invention. The court below found invention, and elaborately and forcefully stated its reasons for its conclusion. The petition does not challenge this reasoning or this conclusion,—except as challenge may be found in the three "reasons." (But see Sec. II, *infra.*)

(2) *That Gulick and Maynard were anticipated* by Long or by Franquist or by Schmiedeknecht or by Spillman & Mooers, etc. In each of the Gulick-Long interferences found to involve patentable subject matter, priority was awarded to Gulick.* Defendant did not think proper to call Long as a witness in this case. Schmiedeknecht, although he had a slightly earlier filing date than Gulick, was not carried back of Gulick's invention date, and is not prior art. The patented claims in suit each distinguish from Franquist and Mooers & Spillman. Each is foreign to Gulick's basic thought, in structure, mode of operation, and results, and both were before the Patent Office and repeatedly considered by the Examiner (R. pp. 1843, 1857, 1938, 1946) and in many *inter partes* interference proceedings. (R. pp. 1549, 1555, 1577, 1657, 1660, 1665, 1666, 1936 and 1937.) Both experts agreed that each prior art device required modification to obtain the structure, mode of operation, and results of the patents in suit. (R. pp. 567, 528, 529, 952, 986.) All of this is

---

* R. pp. 1533, 1538, 1544, 1553, 1564, 1569, 1571 (17 Fed. (2) 686); 47 Fed. (2) 365 and 47 Fed. (2) 366, involving Gulick patent claims 1, 2, 11, 12, 13, 15, 28, 29, 30, 31 and 32. Long copied claims 1, 2, 11, 12, 13, 15, 30, 31 and 32 from the Gulick application wherein these claims originated.

immaterial, if we are right in our belief that these issues were not presented in the petition. (But see Sec. II, *infra.*)

(3) *That Gulick had abandoned his invention, or had put it in public use at a fatally early date.* The brief contains many references to this contention; but, clearly, these questions are not now involved. (But see Sec. II, *infra.*)

(4) *That the legal title to Gulick and Maynard patents had been united with others in an estate under an express trust, here referred to as a patent pool.* This subject has only remote and inconsequential bearing on any of the "reasons relied upon," but will be discussed only generally under Sec. I hereof. Petitioners' brief comes to the "patent pool" again and again as if it affected plaintiff's right to sue or right to recover, and as if the question of unlawful monopoly were somehow involved and the ownership of these patents by an estate was reprehensible. (See Sec. II, *infra,* for our discussion.)

These and other points urged or recounted in petitioners' brief we believe are not within the proper scope of this hearing; but we do not wish to avoid discussion of them, if the Court should think them to be involved. We therefore propose, in Section I of this brief, to discuss the three reasons which were relied upon for the allowance of the writ, and in the following Section II the claims or theories which petitioners now present by their brief.

SECTION I.—THE QUESTIONS PRESENTED BY THE PETITION.

PETITIONERS' "REASON" NUMBER ONE.

Petitioners' first reason relied upon,—disregard of *Permutit v. Graver,*—eventually leads to and depends upon the disclosure of the yielding or flexible character of the structure, as that character may affect the validity of the Gulick and Maynard patents. This character may be named (not very accurately) web flexibility.

WEB FLEXIBILITY—IN THE ABSTRACT.

In approaching this subject,—which constitutes we believe the gist of the controversy which this Court intended to review,—the first essential is that we appreciate the inherent properties of a flat metal sheet, relatively thin as compared to its length and breadth, referred to in both original applications as a "web."* Everyone has always known that as against a force exerted in the plane of its length or breadth, it is strongly resistant and tends to be strong and rigid, while, as against a force at right angles to its plane, it tends to bend. In other words, it is rigid in one direction and flexible in the other. No amount of descriptive words can make these properties more certain and sure; no absence of words expressly stating these properties can make their presence less certain and obvious.

In the Gulick and Maynard constructions, as described and shown, (and speaking of the piston as when the cylinder is vertical, with the combustion chamber at the top) two webs or flat strips of metal, integral with the head,

---

* Defined in *Webster's New International Dictionary,* Second Edition, as "A thin metal sheet, plate, or strip, * * * as the blade of a sword (Obs.), a saw, etc., the thin sharp part of a colter, * * *"

depend therefrom and carry respectively the pin bosses. These webs have also, carried as far down as the top of the pin bosses, central right-angled flanges obviously intended and operating to strengthen and stiffen this part of the web. The pin bosses, in turn, carry the skirt through laterally extending webs, which functionally seem to be no part of the boss supporting webs, although structurally they are continuous therewith. They have no horizontal stiffening flanges. The depending, boss supporting webs are completely strong and rigid vertically, and as they must be to resist say 1200 explosive blows per minute, and 4800 reversals in direction each minute (running at only 2400 R. P. M.). In the same way, the skirt carrying webs are vertically rigid, and this rigid vertical relationship of head and pin bosses and skirt must always be perfectly preserved, else the device could not stand up a day. The skirt is separated from the head, and one of the thrust bearing faces of the skirt is split longitudinally between the boss connections to permit the skirt to yield to pressure from the cylinder wall.

In operation, as the increasing effects of the heat, affecting cylinder walls or skirt or both, increase the pressure of the skirt upon the walls, the slot in the skirt tends to close, while the skirt still maintains substantially cylindrical shape. It follows inevitably that parts of the skirt supporting webs yield or flex at right angles to the plane of those webs—at least enough to permit the slot to close somewhat and thus compensate for the skirt expansion. This demonstrates horizontal lateral flexibility in the webs at that point,—though probably not enough to be seen with the naked eye. Without this degree of lateral flexibility (slight though it is) in the skirt supporting web, the structure could not operate, as

its operation is obvious from inspection and is described in the (original) specifications of Gulick and Maynard and as the experts on both sides say it will operate.

This is the physical structure as to which petitioner's contention arises. The physical structure and mode of operation of both the Gulick and Maynard pistons are fully described. The complaint is that the webs 17 and 18 of Gulick were not, in the original application, said to be flexible in a lateral direction and that neither the Maynard application or the issued patent specifically said that those webs were flexible. Each application did describe the yielding properties of the skirt and the reason for the longitudinal split in the skirt and its relation to the remaining structural elements of the piston. Judge Simons elaborated on this subject. (See R. pp. 2384-2386.)

WEB FLEXIBILITY AS AN ELEMENT.

From the petition and petitioners' brief the reader would suppose that, by belated amendment, this flexibility was added as an element to the structure of the Gulick piston or must be read into the structure of the Maynard piston. In each the structure, mode of operation, and results were described in the original application.

We say that the whole theory of petitioners (which seems to be their outstanding theory) to the effect that a new element was inserted by amendment or is now to be read into these piston patents, utterly fails in fact. No new element was inserted; no new element is to be read in. The structure, mode of operation and results remain the same as before.

THE COURT OF APPEALS DID NOT SAY THAT A WEB THAT WAS FLEXIBLE WAS AN ESSENTIAL ELEMENT OF THE PATENTED PISTONS.

Hence not only the petition for certiorari in this cause, but the petitioners' case here is based upon a false premise.

What the Court of Appeals said was that "flexible webs" (92 Fed. (2) 337) and "webs laterally flexible" (92 Fed. (2) 334) were elements employed in the pistons illustrated in the patents in suit, which, of course, illustrate no more than the preferred forms of the inventions covered thereby and do not limit the patents to the structural details illustrated (R. p. 1286), as is the well established rule of law (*U. S. v. Societe*, 224 U. S. 309, 328; *Winans v. Denmead*, 15 How. 341; *Machine Company v. Murphy*, 97 U. S. 120).

In further describing the particular embodiments illustrated in the patents in suit the Court of Appeals said (R. p. 2385):

> "Gulick separated the smaller ring carrying head of the piston from the somewhat larger skirt by a groove or air gap. This tends to prevent the passage of heat from the head directly to the skirt and permits the bearing faces of the skirt to yield to pressure independently of the head. The wrist pin bosses are pulled inwardly from the skirt periphery, and instead of being supported by the skirt are carried from the piston head by depending flanges, thus providing a vertically rigid support for the bosses with freedom of lateral motion in a direction at right angles to the load thrusts on the piston."

This is merely a description of how Mr. Gulick arranges and operates the embodiments of his invention illustrated in his patent. The Court does not say that the "lateral motion" must be realized by web flexing; there

is nothing in this statement, or any other part of the opinion, limiting the lateral motion to one secured by flexing of the web. Certainly there is nothing in this or any other statement which can be taken as justification for revoking or ignoring the rules in the cases in this Court cited.

It has never been the law that a court's discussion of the properties of the elements in a patent claim make those properties essential. We do not believe that any court in writing an opinion ever intended or expected that its language would either be so construed or so urged.

Therefore, counsel are asking that the patents be invalidated because the Court of Appeals held that the flexible web was a sine qua non when the Court of Appeals did no such thing. Even if that Court had done so, it would have been error in view of the rule stated by this Court in *Winans v. Denmead* and the other cases cited *supra*.

Therefore, petitioners' cause is based on a premise which is false in fact and unsound in law, if true.

FLEXIBILITY, ORIGINAL AND INHERENT, AS ADJUDICATED BY THE TECHNICAL TRIBUNALS.

Rarely (never within the knowledge of respondent's counsel) has the very point in issue been so completely and so often decided, and without dissent. Gulick was involved in fourteen interferences (not all of which appear in the Record). Over and over again his various opponents seized upon the point which petitioners now make, viz., that Gulick's original application did not expressly specify any lateral web flexibility, and therefore he was not entitled later further to describe the web elements of his structural combination as having this inherent property.

If an amendment is made in a specification that is not fairly within the scope of the original application, this is called, in patent office nomenclature, "new matter." And as to that, the applicant is not entitled to his original filing date. The rule is fundamental that it is *not* new matter for the applicant to add, in express words, anything which was fairly and reasonably disclosed in the original specification.

By patent office practice, when an interferant thinks his opponent's specification does not justify the claim in controversy, he makes a motion to dissolve the interference because his opponent is not entitled to "make the claim." The primary examiner, in declaring the interference, has considered and declared that each party was entitled to make the claim. Such a motion to dissolve is referred to the law examiner. If he overrules it, the interference proceeds on this basis to the examiner of interferences, who may refuse to follow the law examiner. The question thereafter persists in successive appeals to the appellate tribunals.

Gulick's opponents, one after another, adopted this practice. It goes without saying that the patent office officials and tribunals, by constant familiarity with these principles and their application, are presumptively far better fitted to decide what is "new matter" and whether an applicant can "make the claim," than is some lawyer, however generally intelligent, who has had no experience along this line but happens to be appointed Master in a patent case.

In one of the Long-Gulick interferences the law examiner considered an interference count which afterwards became Claim 13 of the Gulick patent. The law examiner said (R. 1542):

"If the split permits free expansion and contraction of the skirt portion there is no need for argument to support Gulick's right to make the count. * * * An expansion and contraction of the skirt portion is therefore permitted by the longitudinal slit. * * * If the skirt expands circumferentially when heated, as the specification states, the flanges or ribs 17 and 18 must allow such expansion, and it is not material for the present purpose whether they move about one end or are slightly flexed laterally. The stated purpose of the longitudinal split being to prevent too great circumferential expansion, obviously some circumferential expansion takes place. * * * Gulick discloses all the structural elements set forth in the count, and refers to the circumferential expansion of the skirt, the split 21 preventing too great an expansion. This seems to be all that is necessary, and it is not important how Gulick may have described his device if as a matter of fact it has the requisite structure and function."

This decision was on April 4, 1924, and the same day the same law examiner decided the same question upon a similar motion of Hartog in another interference. The count (R. 1549) afterwards became Claim 29 of the patent suit (not one of the claims now involved). It called in words for "internal yielding ribs, etc." The law examiner said (R. 1549-50):

"It will be apparent that the question for decision is whether or not the ribs 17, 18, 20 are yielding. * * * There are several forces at work etc. * * * it is not seen how * * * some lateral flexure or yielding of the rib [web] 18 between the boss and the skirt can be avoided. The yielding need not be great or due to any special structure of the rib to support the count. Nor is it necessary that the entire rib should yield. If it yields at all for any purpose or for any reason, it would come within the scope of the count. It can not be conceded that the purpose of slot 21 in Gulick's skirt is defeated by alleged rigidity of the lower parts of the ribs."

One of the interferences with Hartog and Long was heard before the examiner of interferences July 2, 1928. He says (R. 1551-2) that there is no sufficient reason to disturb the holding of the law examiner, and he notes that the Court of Appeals of the District of Columbia has then already ruled that the Gulick webs are necessarily flexed under the action of heat. In another interference on the same day he made the same ruling. (R. 1534.)

The Long-Gulick interference was appealed to the Board of Examiners-in-Chief, whose decision was made August 7, 1924. (R. 1544). The Board said:

> "The right of Gulick to make the claim is now raised as the sole ground of this appeal. * * * It is admitted that the drawings of Gulick disclose all the structure specified in the count, the only contention being that his structure is such that it will not 'permit free expansion and contraction of the skirt portion.' The skirt is split at 21 and the specification states, page 3, line 21: 'In order that the skirt may not expand an undue amount when the piston is heated, as under operating conditions, it is split longitudinally as at 21.' The object of the split is to permit this expansion * * *. If the webs 17 and 18 were so rigid that they would not yield laterally, the slot would have no function. Under the action of the heat, the circumferential expansion of the skirt would necessarily flex the webs 17 and 18 sufficiently to permit the expansion without substantial increase of the diameter of the skirt.
>
> "We have no doubt that Gulick can make the claim."

One of the interferences reached the Commissioner of Patents (acting by the first assistant). The same point was involved. In a careful opinion (R. 1663-1666) he discussed the questions involved concluding (p. 1665):

> "It is believed plain that the latter (Gulick) is entitled to make the count of the issue."

One of these interferences, and involving the same question, came before the Patent Office Board of Appeals,* which said, (R. 1539):

"It is urged by both Long and Hartog that Gulick is not entitled to make the count. It is contended that there was nothing in the original disclosure of the Gulick application which in any way referred to the means for supporting the skirt of the piston as being resilient. * * * We reach the conclusion that although there is nothing in Gulick's application as originally filed that refers to resiliency, we consider that this feature is necessarily inherent in the structure, as the support for the split skirt must be resilient in order to allow the piston to expand without expanding the skirt. **We therefore concur in the decision of the law examiner.**"

On a petition for rehearing the Board said (R. 1556-7):

"* * * Hartog urges that we were in error in holding that the party **Gulick had a right to make the count because the support for the piston skirt must necessarily be resilient.** We have given careful consideration to the memorandum offered in support of the petition but it is unnecessary to discuss this in detail. All the matters referred to therein were before us at the time our decision was rendered and were carefully considered. The point upon which the reconsideration is asked is probably the most important one in the entire series of interferences in which the petitioner is involved. The point has been repeatedly considered in one form or another by tribunals of this office and also in one instance by the Court. We reviewed the entire record and carefully considered the arguments presented. **As a result of this investigation our judgment was deliberately made** and we find no reasons presented in this petition which influence us to reach any other conclusion."

* Of which the Assistant Commissioner of Patents was a member.

In still another appeal the Board said (R. 1560):

"* * * It is perfectly clear, however, that when the piston skirt was split it was for the purpose of allowing it to yield when the heat caused the piston to expand. If the piston expands and the skirt does not we consider that the support for the skirt must necessarily be resilient and that this is an inherent quality of all pistons of this general nature. We therefore concur in the opinion of the law examiner as referred to in the opinion of the Examiner of Interferences that Gulick has a right to make the count."

This conclusion was not only unanimously reached by all the patent office officials and boards but also by the District of Columbia courts having appellate jurisdiction. In *Long v. Gulick*, 17 F. (2d) 686, (R. 1546) the Court of Appeals recites Long's contention that Gulick had no right to make the claim and the denial of the motion by the law examiner, by the board of examiners-in-chief and by the Commissioner of Patents, and says:

"The drawings of Gulick we think clearly disclose the structure of the count. (Claim 13 of the Gulick patent.) It is contended, however, that his structure is not such as will 'permit free expansion and contraction of the skirt portion.' But the claim expressly covers this objection in the following language: 'Said skirt being split from top to bottom on one side only of the pin bosses to permit free expansion and contraction of the skirt portion.' We think it clear that the object of the split is to permit of this expansion and, as held by the Board of Examiners, 'under the action of the heat the circumferential expansion of the skirt would necessarily flex the webs sufficiently to permit the expansion without substantial increase of the diameter of the skirt.' In this view of the case, the right of Gulick to make the claim is beyond question."

Another interference involving the same question reached the Court of Customs and Patent Appeals, and is reported in 47 F. (2d) 365, 366. The Court said:

> "The only issue presented in this case, as now stands, is whether or not Gulick had the right to make the claim. [Count 2 of the interference, Claim 31 of the patent, not in suit.] * * * (Reciting a long succession of patent office rulings) * * * (p. 367). It seems clear to us that, if the slot in the skirt of the Gulick piston takes care of expansion, it is by reason of the fact that the cylinder engaging portions of the skirt flex or yield, which yielding or flexing must necessarily result, at least in part, from the resiliency of the joining means. **We conclude that Gulick had the right to make the claim.**"

The same court in another appeal (47 F. (2d) 367, 8, R. 1562-3) reexamined the same question, and adhered to its decision.

When, to these decisions of the patent office and District of Columbia tribunals, we add the discussion and conclusion of the court below, we have some eight or ten patent office officials and eleven judges of federal courts all agreeing that Gulick's original application sufficiently disclosed the existence of web flexibility. On the other side there is only the Master; and the controlling point, that the specification-described skirt action necessarily involved this flexibility, was never even observed by the Master, so far as his report shows.*

PERMUTIT v. GRAVER.

Petitioners attempt to escape from the official and judicial consensus as to the originally sufficient disclosure of

---

*He said (R. 1152) that Gulick could not rely on the inherent flexibility because it was not novel,—not at all because it had not been sufficiently implied to be a good disclosure.

flexibility, only by saying that these tribunals, in order to reach their conclusion, went beyond the specification and depended essentially upon drawings of something not described,—inconsistently with the later decision in *Permutit v. Graver*. This is a misapprehension; there was no such dependence on drawings, but indeed if there had been, it would have been proper, under the circumstances and for the use made of it in this case and, at the time of such use.

Petitioners' whole case, under this first reason (and indeed upon the second and third) depends upon the supposed rule of *Permutit v. Graver*. There is no such even superficial analogy as requires extended discussion. This for several reasons:

1. In *Permutit v. Graver* the court was considering only the patent, as issued, and held that a vital structural element, the "free" bed, not shown in the drawings or described in the specification (indeed probably in conflict therewith), could not be read into the issued patent to save it from anticipation. There is no such question here. No one doubts that the specification of the Gulick patent, as issued, sufficiently describes web flexibility. Petitioners' complaint is that the specification had been improperly amended. In *Permutit v. Graver* there had been no amendment.

2. In *Permutit v. Graver*, the element which the court below had erroneously read into the patent was a structural element (although in negative form). As the patent had been reconstructed by the court below, it called for the absence from the structure of a locking cover. In the present case neither the presence nor absence of any structural element is involved. The complaint is that (before amendment) the specification did

not describe an inherent functional property of the material of which a completely disclosed structure was made. In *Permutit v. Graver* there was no such question.

3. In *Permutit v. Graver,* the erroneously supplied element had been the one by which alone the invention was distinguished from the prior art, and by which alone anticipation was avoided. The prior art showed the exact combination of the patent claim, unless for this one feature. In the present case the prior art did not show any anticipation, that was complete excepting for this one feature. There was no prior structure having the complete combination of physical parts claimed in Gulick and Maynard except for having webs which were rigid in all directions against all stresses. The Gulick and Maynard patents were for these physical combinations of structural elements, with whatever inherent properties the individual elements of the combination might have.

4. The question now here is not about construction of a patent, as issued and as affected by R. S. 4888; it is only about the sufficiency of a disclosure in an original specification and drawing in order to justify an amendment in the Patent Office, before issue, inserting a few additional words of description concerning the structure already completely shown and described. It has always been the fundamental rule of procedure in the Patent Office that the specification and drawing together constitute the disclosure, and deficiencies in either might be supplied from the other, if the disclosure in the other was clear enough. So far as we know, this rule has never been questioned in the Patent Office or by any court. The Patent Office, in permitting or denying such an amend-

ment, is concerned only with the question "is it, considering both specification and drawings, new matter, or is it consistent with and to be reasonably implied from the original disclosure though completely shown only in the specification and not in the drawing or only in the drawing and not in the specification?" The Patent Office doubtless should look favorably upon an amendment to a specification or drawing which is only of explanatory character.

5. If it were to be assumed that *Permutit v. Graver* was intended to hold (for which assumption there is no basis) that the Patent Office, in approving a specification amendment as not being new matter, could not depend upon the drawing alone, unaided by the specification description, as negativing the "new matter" objection, it would not be important, because there was here no such sole dependence. All the Patent Office tribunals and the reviewing courts placed their dependence upon that part of the specification which distinctly explained the expansion of the skirt and the limitation of that expansion so that the vertical slot would somewhat close. Neither any Patent Office tribunal nor any court referred to the drawing, except in a casual way to say that it was sufficient to show the structure which the specification was describing. No one has ever disputed this; both experts agree that the original disclosure by specification and drawing was sufficient so that anyone skilled in the art could not fail to produce therefrom the piston of the patents, and that if it was made of any material proper for that purpose and as any skilled mechanic would inevitably make it, the webs would have enough horizontal flexibility or yieldability so that the slot would close as intended and the piston would work. Petitioners' whole

theory that the patents were sustained because the drawings, and only the drawings, showed web flexibility, is an illusion,—not to say a delusion.

There is no need to consider *Permutit v. Graver* more fully; but in Section II we further discuss the true basis and extent of the rule.

THE AMENDMENT OF SEPTEMBER 12, 1922.

Neither at this, nor at any other, time was any one of the claims which were sustained by the court below amended by inserting any reference to web flexibility. So far as now material, the only changes made in the specification were (1) to change the word "extremely" to the word "longitudinally," so that the phrase "the above described construction also provides an extremely rigid connection between the piston pin bosses and the skirt" was thus modified, to read "the above described construction also provides a longitudinally rigid construction between the pin bosses and the guide portion of the piston," and (2) to add that "at the same time, when the longitudinal slit is used, as shown, the web structure has sufficient lateral flexibility to permit the split to close more or less under the action of the expansion forces incident to the heating of the piston." The original language, which was also maintained, was "in order that the skirt may not expand an undue amount when the piston is heated, as under operating conditions, it is split longitudinally as at 21."

Thus we see that the original specification sufficiently disclosed all the mechanical elements of the combination structure, and explained that the office of the slit was to prevent undue expansion of the skirt when the piston was heated under operating conditions. Obviously, this refers

to such an expansion of the diameter of the skirt as would conflict with the interior diameter of the cylinder. Equally obviously, this undue expansion of the skirt diameter would not occur because the slot would close, and so, though the skirt walls could expand circumferentially the skirt diameter would not increase. No elaboration can make it more obvious than it now is and then was, on mere inspection, that there must be at some point in the skirt connections some trifling lateral yielding. This amendment stated in express words what was already necessarily implied. So all the imposing array of tribunals and the court below have held. The Master did not undertake to deny that this degree of lateral flexibility was inherent in the original description; he simply ignored that view.

There is no inconsistency between the original statement that the specified construction provided an extremely rigid connection between the pin bosses and the skirt and the amended statement that this extreme strength and rigidity pertains to the longitudinally exerted forces and that there is, nevertheless, such a slight degree of horizontal yielding as permits the slot to operate as intended. Granting this full lateral flexibility (and slight indeed it is) the structure nevertheless does, as originally stated, provide an extremely rigid supporting construction for the skirt. The strength and rigidity which were required were longitudinal. The charge of inconsistency between the earlier and the later statements is in the highest degree technical; there is no substance in it.

THE POWERS-KENNEDY CASE.

Several references are made to this case. It has no bearing on any question here. The only pertinent holding thereof is that if the specification is amended so as to disclose an invention not disclosed by the original specification, this is new matter and the patent is invalid. No one questions that rule. In *Powers v. Kennedy* the opinion demonstrates that the original specification did not disclose that the concrete was to be pushed forward in slugs rather than continuously, but indicated only the continuous operation. The invention supposed to reside in the successive slug action was first disclosed in the amendment; with that premise the result was inevitable.

Incorrect inferences have sometimes been drawn from the casual reference in the opinion to the fact that the patentee had copied the claims of another applicant. The comment that "this of itself destroys the patent" refers, as the context shows, not to the copying of the claims (which is familiar and indeed necessary Patent Office practice*) but to the fact that the patentee had "lifted" the finally claimed invention out of the application of the other man.

Petitioner's brief, apparently in this connection, refers to the fact that Gulick copied from Hartog one of the claims involved in the interferences.** Very true.

---

* Just as Long copied Gulick claims, and went into interference (decided for Gulick).

** Counsel strain to bring the instant cause within the facts of *Powers-Kennedy v. Concrete*, finding it necessary to resort to the Hartog-Pomeroy interference to draw an analogy with the Leake-McMasters interference of the cited cause. Gulick was not in the Hartog-Pomeroy interference. Neither respondent nor the Aluminum Company conducted the interference on behalf of Pomeroy. The Pomeroy patent (R. pp. 1804 and 185) was bought from the inventor long after conclu-

Learning of the phraseology in which Hartog was expressing the common invention, Gulick added a claim in the same phraseology. There was an interference and the Patent office and the courts decided that, based on his original specification, Gulick was entitled to make this claim. So it was awarded to him and it became Claim 29 of the Gulick patent; but it was not passed upon by the court below and it is not involved under any of the issues presented by the petition.

THERE WERE NO INTERVENING OR ADVERSE RIGHTS.

Petitioners argue that there was an *attempt* to broaden the original Gulick application after intervening rights arose, by limiting the web element of the structural combination to a flexible web element, and that, because of this attempt the patent is invalid. (Brief p. 11, enlarging petition p. 9 as to adverse rights.) It is necessary to argue an "attempt to broaden" because the scope of the original claims (1 to 10, inclusive, of the issued patent,

---

tion of the Hartog-Pomeroy interference. The Hartog patent (R. p. 1798) was bought after conclusion of the Gulick-Hartog-Long interferences. These facts conclusively distinguish the causes without examining the other facts or the failure of counsel to establish the facts upon which reliance is had. If counsel are correct, this Court held the patent in the cited case invalid because an apparatus patent specification was amended to correct the description of the principle of operation; if counsel are correct the cited case is not applicable here since the amendment of the Gulick application did not change or apply to the principle of operation, but to an amplification of a description of the properties inherent in an element. Moreover, counsel's contention would place this Court's decision in hopeless confusion with the law announced by this Court in *Eames v. Andrews*, 122 U. S. 40, 56, to the effect that an inventor does not have to know or disclose—indeed, he may even misunderstand and misdescribe—the principle upon which his machine operates so long as he describes his apparatus and how to use it, a sound rule of patent law that has been followed ever since by all patent Courts. If the rule were otherwise, all radio and other electric patents, for example, would be invalid because nobody knows what electricity is or the principles upon which it works. They know it by what it does.

claims 2 to 9 being subsequently amended to restrict their scope) comprehended structural combinations embodying the web elements of each device of the contestants in the interference proceedings, including Long. The Court of Appeals, for instance, has held claim 1 of the Gulick patent valid and infringed by the Exhibit 1 structure in this suit. (R. p. 2395.) Since this claim 1 of the patent was in the application as filed (then claim 3 R. p. 1840) and remained in the application with no change whatever, and now appears in the issued patent, there were no intervening rights. This claim 1 of the Gulick patent is verbatim as it was when filed on November 20, 1917, and was allowed in the first Patent Office action. (R. p. 1840 and 1844.) It was copied from the Gulick application by Long and others and was subjected to repeated and bitter attack as to validity in the interference controversies on the same prior art patents that are now asserted by petitioner. (R. pp. 1571, 1936 and 1937.) On these facts petitioners' arguments on intervening rights must fall.

We have now briefly summarized our views as to petitioners' first "reason." Elaboration will be found in Section Two *infra*.

PETITIONERS' "REASON" NUMBER TWO.

A supposed violation of the rule of *Adamson v. Gilliland*, is petitioners' second "reason relied upon." Petitioners have in mind some conflict between fact findings made by the Master and the conclusions reached in Judge Simons' opinion. We are quite unable, from the petition, to identify the conflict to which the petitioners intend to refer.

Petitioners say that the Court of Appeals held that its conclusion, that the aluminum piston problem was not solved until by Gulick and Maynard, was based only upon evidence as to the payment of royalties under the patent pool. The Court of Appeals took no such basis for its conclusion. Its holding was based on the fact that the automobile industry never had adopted to any substantial effect any of the previous inventions, but they had all been commercial failures, while the industry then did adopt to an overwhelming extent forms which embodied the Gulick and Maynard inventions. Instead of holding that this general adoption was because of royalty payments, the court held and made very clear that owing to the elimination of sticking, slapping, etc., without destroying ruggedness and durability, this adoption must have been because the novelty and merit of these inventions were appealing. The mere payment of royalties is among the weakest proofs of industrial approval, as has frequently been held. The Court of Appeals cannot fairly be charged with resting its conclusion on any such slender reed. (See R. pp. 2386-2388.)

Next, the petition seems to say that the Master held that the success of the aluminum piston was ascribable to other things than these inventions, and that the Court of Appeals overruled the Master,—who had seen and heard the witnesses. The fact is, as we view the record, that there was no substantial basis in the evidence for any such conclusion by the Master and we are unable to identify any such finding in his report. So far as we can understand, it all comes to a question of invention over the prior art, which (if not one of law) is at best a mixed question of law and fact. The Master thought there was no invention over Franquist, or over Spillman &

Mooers, or over others of the prior art. Therefore, he thought that the success of the aluminum piston was due largely to these old features rather than to Gulick and Maynard, who had arranged and assembled and modified them into the new and patentable form which the industry adopted and defendant copied. The Master further thought, without any support in the record, that a later trifling modification in the Gulick-Maynard form, which he calls the "Keystone relief," and which had been made by the plaintiff's licensees and which the infringing defendant had copied, played a part in the commercial success. This was such a trifling change, and so clearly did not get away from the Gulick and Maynard patents, that it is difficult to take the claim seriously. The Master had no basis in the evidence for his conclusion,—as one of fact. His conclusion that the Gulick and Maynard patents had not gone into large use, was only another form of his conclusion of law that the patents were invalid, or were confined to their exact form.

Perhaps what can be most plausibly claimed to be conflict between the Master and the Court of Appeals has reference to the adoption and use of the patented pistons by the industry. In aid of the presumption of patentability, plaintiff contended that the industry had accepted and used the Gulick and Maynard pistons, or pistons embodying these inventions, by the million. Such a contention is always, of course, only a make-weight argument, tending to show that the improvements which the patentee had made were of an inventive character rather than embodying only ordinary skill. This contention is in each case of more or less importance according to the circumstances of that case. The court below gave this general acceptance some weight in reaching its conclu-

sion sustaining the patents; but it is never, by itself, of controlling importance.* We doubt whether this Court has ever reversed a Court of Appeals because this Court thought that court, in deciding a question of fact, to have given too much weight to one of the subordinate evidential facts.

Let us see what the supposed conflict was. The Master found that the "structures of none of the pistons in suit have ever gone into commercial use." (R. 1182.) The undisputed evidence was that pistons made by the licensees under Gulick and Maynard (and—in denial of the patents—by the Sterling Company) and in forms held by the Court of Appeals to be within the patents, had come into very general use in the industry and were counted by tens of millions. The finding of the Master, if it is to be reconciled with these undisputed facts, therefore *must mean* that the *precise and exact form* which happened to be shown in the patent office drawings of Gulick and Maynard did not go into general use.** Such superficial conflict as there is between the finding of the Master and the conclusions of the Court of Appeals is therefore nothing but a *question of law* as to whether general acceptance by the industry of a form embodying the principles of the patent and infringing the patent ceases to have evidential force of utility and novelty just because relatively trifling changes or improvements have

---

* The Court of Appeals said: "These [rules] have proved helpful, even though never absolute (R. 2387) * * * It is, of course, axiomatic that commercial success is not of itself conclusive upon the question of novelty or invention." (R. 2388.)

** Even with this construction it is not true as to Maynard, which, in the precise form, was used in large numbers before the licensees made some changes which, from the patent standpoint, were trifling and immaterial, but which petitioners slavishly copied.

been included. Upon this question of law the Master was wrong; the Court of Appeals was right.

Thus it appears that on this record no possible question arises as to whether the Court of Appeals had the power and the right to find that there had been general public acceptance; the Master had made no fact decision to the contrary. However, the conclusion which is sometimes drawn from *Adamson v. Gilliland,* that the finding of a Master, supported by some testimony, is as sacrosanct as the verdict of a jury, is an unfortunate fallacy. We relegate a discussion of it to our Section II.

Clearly, this "reason" does not reach the question whether the Court of Appeals was bound to follow the Master's conclusion about anticipation by Long, or abandonment by Gulick, or anything else not alleged in the petition as a "reason."

PETITIONERS' "REASON" NUMBER THREE.

This was (petition p. 11) only that the Court of Appeals had erred in holding that the presumption of validity, as fortified here by the repeated Patent Office decisions, should prevail unless overthrown by "clear and cogent evidence," and that this was error because these fortifying decisions had been founded on a legal basis inconsistent with *Permutit v. Graver.* This is only another way of stating the first "reason," viz., that these decisions involved an unauthorized dependence upon the unaided drawings rather than upon the specification with appropriate aid from the drawings. This point has already been fully discussed; in truth, these decisions did not, to any extent whatever, rest upon the drawings alone; they rested upon the description of the operation which the specification gave and which was at once completely

informative, calling upon the drawings only to show the general structure and the physical interrelation of the parts.

Clearly, this "reason" does not reach the question whether the evidence of anticipation by Long was sufficiently "clear and cogent,"—or any similar question.

The foregoing considerations are believed to make it clear that the three "reasons relied upon" in the petition find no such basis in this record as justifies petitioners in the greater part of the discussions found in their brief. We have briefly summarized our positions for the purpose stated; and we believe this brief could properly stop here. However, lest the Court might not agree, we proceed in the following Section II to greater detail in the subjects already discussed,—avoiding repetition as much as possible,—and in the form of answer what is said by petitioners on many specific subjects.

SECTION II.—ANSWER TO PETITIONER'S BRIEF.

The Specification of Errors Assigned and Urged by the petitioners relate to the general law; they are not particular or confined to patents or the patent law. A patent is a contract and the requirements of a sufficiency of disclosure of the subject matter covered thereby is primarily a contract question. The weight to be given the Master's views against those of a Circuit Judge, or a bench of Circuit Judges (or three benches of Circuit Judges, as is the case here on disclosure) is, on its face, a general law question. Whether or not the recognized presumption of validity of a grant affirmed by one or by three appeal Courts, as affected by a later decision of this Court, is a general question by no means peculiar to the patent law. These things being so it follows, as a matter of course, that whether or not the Circuit Court of Appeals in the Sixth Circuit was

right or wrong in reversing the District Court is a matter of general, and not of patent, law.

In these premises we have little to say here as to the validity or infringement of the patents in suit. If any such question is to be considered here under any of the errors assigned, we cannot hope to do better in so short a space than refer this Court to the discussions of Judge Simons (R. pp. 2381 to 2395) who wrote the opinion for the Sixth Circuit Court of Appeals (Judges Hicks, Simons and Allen). As stated by the Court in the beginning of the opinion, that Court had recently considered two lengthy records relating to internal combustion engines to which the patents in suit here relate. Judge Simons had considered both records and written both opinions. Therefore, at the time he wrote the opinion in the instant case it would have been difficult to have found a Judge so well informed and skilled in the art to which the patents in suit here relate.

A reading of Judge Simons' opinion in the instant case not only shows that his conclusions are based upon the patent law as early established and long followed by this Court,* but his opinions in the other two cases (*Waukesha v. Willys-Overland*, 77 Fed. (2) 906 and *Perfect Circle v. Hastings*, 88 Fed. (2) 813) show that his holdings on questions of validity and infringement in the art to which the patents in suit relate, were as strict as those followed by this Court in its recent decisions and that in its opinion in the instant cause the Sixth Circuit Court of Appeals was following the requirements of high standards for patentable invention followed by this Court.

PETITIONERS' POINT I.

WEB FLEXIBILITY AND PERMUTIT v. GRAVER FURTHER DISCUSSED.

The Sixth Circuit Court of Appeals did not add web flexibility as a new element under the patents; it only found that this flexibility was an inherent property of the structure described and shown. The reference to rigidity of the webs in the original Gulick specification is fully satisfied by applying it to the vertical rigidity which did exist rather than to the horizontal rigidity which did not exist. The amendment to the specification only clarified what was already apparent from the original language, and described a property inherent in the webs and known to everyone skilled in the art, as both the petitioners' and respondent's experts testified.

We have already pointed out the nature of these questions and that they had been passed upon and our contention approved by an impressive array of administrative and judicial opinion. We continue more in detail.

No rule of contract law requires that a contract shall describe the features which are inherent in the thing described. A contract for the sale of a cow would not require that the contract state that the cow had a heart or a hide or an udder. All of these things are inherent in every cow. Likewise, the patent law does not require that a patentee shall describe all of the properties that are inherent in a metal web. There was no more reason for stating that the webs are flexible than there was for saying that they were hard, or heat resistant, or heat expansive or durable, etc. ad infinitum, to the last known property of a metal web, all of which are just as essential to the successful performance of the piston as the flexibility of the web. If all of the things inherent in the cow had to be described and all of the inherent properties of the metal parts of a machine had to be described, contracts regarding cows and

patent specifications regarding machines would be endless; it would be just as futile and as endless since it would be merely announcing what was otherwise inevitably known to those versed in those arts. The net result would be confusion through unnecessary verbosity.

We ought not to have to cite any testimony to prove that a web such as shown at 17 and 18 in the Gulick patent and at F in the Maynard patent would be flexible transversely when made of metal. The merest tyro in mechanics would know that it would be, and inherently so. Nevertheless, since this point was urged through the Patent Office Tribunals, through the Court of Appeals of the District of Columbia, through the Court of Customs and Patent Appeals, and raised again in the Courts below, we made specific inquiry on the subject from the experts of both parties. The expert for the petitioners, as well as the expert for the respondent, answered that such webs as were illustrated in the original drawings and described in the original specifications of the Gulick and Maynard patents would be inherently flexible if the piston were made of any metal of which pistons were made or could successfully be made.

It is true that some specific questions asked of the experts mentioned only the drawings, and did not expressly refer to the specification; but it is plain enough that these references are merely to the structure which was described in the specification and illustrated in the drawings. It is a distortion of their testimony to suppose that they intended to say that the particular size and shape of the web itself, as indicated by the drawing, was the basis for their finding of inherent flexibility. The fact that, as described in the specification, it was intended that the slot should close, necessarily underlies and permeates all the thinking of counsel and experts and all the questions and answers along this line.

Respondent's expert, Dr. Jeffries, said:

"Q. State whether or not it would be possible in your opinion to make a piston out of any metal employed for making internal combustion engine pistons and conforming to the drawings of the Gulick patent, without having flexible webs?

A. No, it would not be." (R. p. 201.)

Mr. Stellman, one of petitioners' experts and long the Chief Engineer for the H. H. Franklin Automobile Company, said:

"Q. That is, with your knowledge of the piston industry you would know by looking at the drawings (of the Gulick patent) that those webs would be flexible if the piston was made of material of which you ordinarily made pistons?

A. Yes." (R. p. 568.)

"Q. Referring to the Long patent 1,489,499, I believe you said the webs 8a would be flexible.

A. To a certain degree I should say they would.

Q. And in saying that you assume the piston would be made of the material ordinarily employed in making pistons?

A. Yes.

Q. And the same thing would be true of these webs 17, 18, and 19 in the Gulick patent, wouldn't it?

A. Yes." (R. p. 568)*

We recognize the rule that an inventor may not add new matter to his specification, which is the rule stated in the authorities relied upon by the petitioners,** and we have

---

* In common with a practice followed by most piston patentees, Long did not describe his webs as flexible in his patent No. 1,489,499 or in any other of the several Long patents cited in the record and relied upon so heavily by the petitioners as prior art. (R. pp. 1727, 1731 and 1735.)

All the Patent Office tribunals, and the Court of Customs and Patent Appeals (47 Fed. (2) 365 and 367), held that Gulick antedated Long. (R. pp. 1537, 1539, 1545, 1553, 1561, 1569 and 1571.)

** *Powers-Kennedy v. Concrete*, 282 U. S. 175; *Railway v. Sayles*, 97 U. S. 554, 563; *Permutit v. Graver*, 284 U. S. 52.

no quarrel with that rule, but the rule does not apply to a superfluous amendment of a specification or to the failure to make a superfluous amendment to a specification to describe a property known to be inherent in an element which is illustrated and described. Amending the Gulick specification, which says that the skirt is flexible, to say that the web, which supports the skirt, is flexible, is equivalent to amending a contract regarding a cow to say that the cow has a heart or a hide.

If the authorities cited by the petitioners made any such rule as the petitioners contend, not only would all patents be invalid for insufficiency of disclosure (for none describe all of the properties of all of the elements disclosed therein), but if such rule were extended to contracts, every contract would be invalid, for no contract describes all of the properties of the subject matter covered thereby any more than do the issued patents. If these authorities made the rule, as petitioners say they do, then every decision which has sustained a patent would be wrong because no patent ever sustained described all of the properties inherent in all of the parts. Such a rule would, on its face, be childish because it would burden patents and other contracts with endless and useless verbiage. The rule would be particularly puerile when applied to patents because the properties of elements, such as inherent flexibility of a web, are so well and commonly known to those skilled in the art. Moreover, such a rule would make requirements contrary to the patent statutes which have held that a patent disclosure is sufficient if it is sufficient to instruct those skilled in the art. (U. S. R. S. 4888.) Both the expert of the petitioners and the expert of the respondent in this case were skilled in the art and the patent specifications and drawings involved taught each of those that the webs were inherently flexible.

Such a rule would be particularly disastrous to prior public uses and like prior art other than patents or publications since public uses and like prior art are seldom accompanied by a contemporaneous description at all, and never by descriptions describing such inherent properties as the flexibility of a thin metal web for the very cogent and very simple reason that everyone familiar with such things knows without being told that such is the property of such a web.

In these premises it would be immaterial if this Court had—which it did not—made the incongruous rule that petitioners claim it did in *Permutit v. Graver*, 284 U. S. 52. To say that a disclosure by a drawing alone is insufficient to teach those skilled in the art to which that drawing relates would fly in the teeth of the truth as established by history both ancient and current. The use of drawings as a means of disclosure preceded by many centuries the invention and use of written language. During these many centuries record disclosure was through drawings alone and it was eminently successful; indeed, it is by no means uncertain that the letters used in the first writings were not merely abbreviations of drawings. In every engineering and mechanical art existing today communications are made between those cooperating in the work, such as the engineering and constructing department, through drawings, called blueprints, almost to the exclusion of either written or spoken language. Disclosures by which every constructing man, including those who build skyscrapers, bridges, and other large structures, are received from the designers through these blueprints. We dare say that every one of the hundred million pistons built under the patents in suit were built from blueprints furnished by the designers of the pistons to the builders *de hors* any other description, written or oral. (R. p. 1051.) From the very beginning of the patent practice, the Courts, in considering

prior art devices, have often had before them no other contemporaneous recorded disclosure than that contained in drawings and many patents have been held invalid on disclosures made by drawings alone.

A reference to general contracts emphasizes the impracticability of the proposed rule. Many construction contracts relating to the building of houses and bridges identify the things to be done by drawings attached to the contract. Would the contract be invalid as indefinite because the inherent properties and features of the building or the bridge, or of the materials from which they were formed, were not described in the text of the contract in addition to being illustrated in the drawing and, if so, to make the contract valid would it be necessary to describe the properties of each of the materials of which each of the elements of the building or the bridge were constructed? If a farmer and an agricultural dealer entered into a contract regarding a harvester, illustrated by a drawing attached to the contract, would the contract be invalid if the reel, or the sheath-carrier, or the driver's seat were not described in the text as well as illustrated in the drawing and, if so, would it be necessary, to make the contract valid, to describe the properties of the materials of which these parts were made, although those properties were well known to any farmer or any agricultural dealer who looked at the drawing?

If it were the rule that a drawing adds nothing to the specification, and cannot be at all relied upon where the descriptive language is not complete in all details, then the addition of the drawing would be a useless thing to do. It will not be presumed that the law requires a futile act. Each supplements and perfects the other.

When the instant case is squared with this practice it is found that it would be impossible for anyone making a piston to make it following these drawings (even with no aid from the specification) without making the webs flexible

in the horizontal and rigid in the vertical. (R. 201, 568-9.) As we have said, however, we need not resort to the truth that the drawings were a sufficient disclosure, because the specifications also described the webs, and both experts agree that they would be inherently flexible.

We recognize the rule—and this seems to be the rule in *Permutit v. Graver*—that an element included in a patent disclosure, either through the drawing alone or through the drawing and the specification both, cannot be read out of the disclosure and something else read into the disclosure in its place. As we understand the situation in *Permutit v. Graver,* this Court thought that the patent disclosed a "locked" zeolite bed or a bed in which the zeolite was locked, and that this "locked" bed was read out of the patent and a "free" bed read into it. This refers to structure. We recognize that such a rule is a proper rule when applied to structure and one well grounded in the patent law. No such situation exists in the instant case; in the Maynard patent there was never any change and, therefore, as far as that patent is concerned, there is no ground for even a specious argument that the rule applies to it; in the Gulick patent the original disclosure referred to the rigidity of the webs as "in addition" to the slot in the skirt supported by the webs, in language which the merest tyro in the piston art would recognize as meaning rigidity in the *vertical* plane and not in the horizontal plane. To say that this language meant rigidity in the horizontal plane, as petitioners contend, and must so contend to come even within the shadow of the rule in *Permutit v. Graver,* is inconsistent not only with the language, but also with the disclosure that would be made even by the drawing alone to any one skilled in the piston art.

There is nothing irreconcilable in rigidity and flexibility when in the same web or sheet of metal unless one tries to

read both terms as operating in the same direction. The application of a bit of common sense makes it clear that when read in different directions there is nothing to reconcile; all is plain.

Be that as it may, the fact is that Gulick described his piston as flexible and, in addition to being flexible, as also rigid and that both rigidity and flexibility are inherent in his piston structure. Dr. Jeffries, respondent's expert, said:

> "He (Gulick) does have a rigid piston *longitudinally* and a flexible piston laterally." (R. p. 150.)

If, although flexibility is inherent in Gulick's web, we must show that flexibility therein was described in Gulick's original specification, we say:

Gulick described the structure of these connections from the power transmitting bosses to the piston skirt as "flanges 17" which extend laterally from the bosses "in the form of webs 18." He described the structure of the connection of the "webs" to the skirt and to the piston head. He described the mode of operation of his piston as embodying a skirt slightly separated from the head of the piston and split longitudinally at 21 "so that it would not expand *in circumference* with a force great enough to cause the piston to stick in the cylinder." He described the piston as a whole as adapted not to "expand against the cylinder wall to such an extent as to seize or stick." He also said that, *in addition* to providing the *piston with a skirt* that was separated from the head and was split so that it would not expand from heat an undue amount under operating conditions, the construction of the webs previously described by him also provided an extremely rigid connection between the piston pin bosses and the skirt of the piston. He also described the arrangement of the supporting flanges or webs as providing "a particularly strong support for the bosses."

Therefore, Gulick, in his original application,* *described his structure as both rigid and flexible.* He said that *in addition* to this flexibility of the piston skirt, he *also* provided an extremely rigid connection between the bosses and the skirt. Having described the piston as a whole and the skirt in particular as flexible in the direction of the pressure from the cylinder wall, it seems to us that it was unnecessary for him then to say that each part of the supporting structure that carries the bearing or working faces of the skirt was flexible or what degree of

---

* As to the functional operation of the piston in an engine cylinder, the Gulick application as originally filed said (R. 1837-9):

"One of the objects of the present invention is to provide a piston which is not adapted to expand against the cylinder wall to such an extent as to seize or stick.

"Another object of the invention is to provide a piston with a skirt slightly separated from the head of the piston and split longitudinally so that it will not expand in circumference with a force great enough to cause the piston to stick in the cylinder."

"Another object of the invention is to rigidly support the piston pin bosses of a piston from the piston walls." * * *

"These flanges extend laterally of their respective bosses in the form of webs 18 which integrally connect with the wall of the skirt * * *."

"Thus, the bosses are connected to both the head and the skirt so that the latter is held in its proper position directly beneath the head as shown in Figs. 1 and 2."

"In order that the skirt may not expand an undue amount when the piston is heated, as under operating conditions, it is split longitudinally as at 21."

"It will be seen that in addition to providing a piston with a split skirt, the above described construction also provides an extremely rigid connection between the piston pin bosses and the skirt of the pistons, * * *"

"The arrangement of the supporting flanges 17 between the ends of the piston pin bosses and the connections of those flanges with the piston skirt provide a particularly strong support for the bosses."

flexibility was required of each part during different conditions of operation or to describe the other inherent properties of the structure in any more detail than necessary to instruct those skilled in the art how to make a piston having the structure necessary to obtain this mode of operation and the results of Gulick's invention. The instruction given was definite and certain.* Those skilled in the art, as were the two experts, were unable to produce anything other than a piston that, as Gulick originally said, is rigid in one direction and flexible in another direction, as their previously quoted testimony shows. There is no evidence and no finding that those skilled in the art were unable to make the piston from the disclosure originally given or that a different piston would be made when the workman was told that the webs were flexible. The disclosure was complete. The change made by amendment was in words only, not in substance. Both petitioners and respondents produced pistons made in accordance with the patent. (Ex. 3-T, R. p. 240; Ex. 20, R. p. 155.)

A patent application, as any other written document, must be taken as a whole in construing its parts. The description of the flexibility in one direction can not be construed as meaning flexibility in all directions without running afoul of the description of rigidity. The description of rigidity as "in addition to" the flexible property of the piston, cannot be read to exclude flexibility. To assert that one must be accepted and the other rejected is to fly in the face of the clear and unequivocal meaning of the description when read as a whole, just the same as any other document is read and construed.

Both of these things are true as to the Gulick piston, just as Gulick originally described them and, as the ex-

---

* R. pp. 150, 151, 193, 577 to 579, and 1071. There is no evidence to the contrary.

perts said, it could not be made otherwise if the drawings were followed. As the Court of Appeals said, speaking through Judge Simons:

> "The wrist pin bosses * * * are carried from the piston head by depending flanges, thus providing a vertically rigid support for the bosses with freedom of lateral motion in a direction at right angles to the load thrusts on the piston." (R. p. 2385.)

The Gulick construction provides a connection between the bosses, the head of the piston and the bearing faces of the piston that is rigid in the plane of the connecting webs, "so that the latter (the skirt) is held in its proper position directly beneath the head." The separation of the bearing face of the piston skirt from the head and the split of the bearing face between the connections of the bearing face to the piston bosses, were arranged so that the skirt would not "expand in circumference with a force great enough to cause the piston to stick in the cylinder" during operating conditions. The lateral flexing of the webs, or "the freedom of lateral motion" as the Court of Appeals said, in a direction at right angles to the power thrusts applied to the piston permitted this operation without detracting from the rigid and unyielding character of the web construction in the direction of the terrific power thrusts on the piston.

As the record shows (R. pp. 589, 920, 962, 1077, 1079 and 1080), two vital and essential things in a piston were ruggedness and durability. The axis of the head that carries the sealing rings must not move away from the axis of the cylinder because this would cock the head of the piston in the cylinder and result in failure of the piston. The powerful side thrust from the bosses to the bearing walls of the piston, produced by the angularity of the connecting rod during the power stroke, must not cause the bosses to move in the direction of the cylinder wall because that would tilt the head of the piston at an angle and

the head would stick or seize in the cylinder, breaking up the piston and probably the motor, with all of the other attendant disadvantages incident to what is described as "weaving" of the piston head. (R. 61-63, 109, 1079 and 1080.) It was essential that these connections from the power transmitting bosses to the bearing walls and to the head of the piston be made rigid enough to transmit these explosive car-driving blows, delivered sixty or more times each second, through the piston to the connecting rod and the engine shaft. In other words, the skirt must remain "in its proper position directly beneath the head." Any relative movement between the bosses and the bearing faces of the piston skirt would result in disaster. This requirement for rigidity was limited to the direction of application of the driving forces working on the piston.

Gulick disposed of the heat problem by creating within the piston structure what amounted to a heat and pressure operated engine, through which the effect of the heat on the expansion of the piston was neutralized by the reaction of the cylinder wall pressure through the oil film to the piston skirt and so as to prevent the skirt from expanding against the cylinder wall to such an extent as to stick or seize.

Petitioners rely heavily, if not exclusively, upon the following sentence which was in the original Gulick application:

> "It will be seen that **in addition** to providing a piston with a split skirt the above described construction **also** provides an extremely rigid connection between the piston pin bosses and the skirt of the piston, which construction may be used either with or without the split skirt and separated head."

It is contended by the petitioners that the rigidity referred to in this sentence meant, or at least included, horizontal rigidity; it is the contention of the respondent that it referred to vertical rigidity only.

The respondent's position is that

(1) Since the functions of a sheet or web of metal are so well known, there could be no ambiguity or no confusion and that anyone, whether skilled or unskilled in the art, who knew anything about the properties of a sheet of metal would know that the rigidity refers to the property in the vertical plane because by the very nature of the sheet it could not be rigid in any other plane.

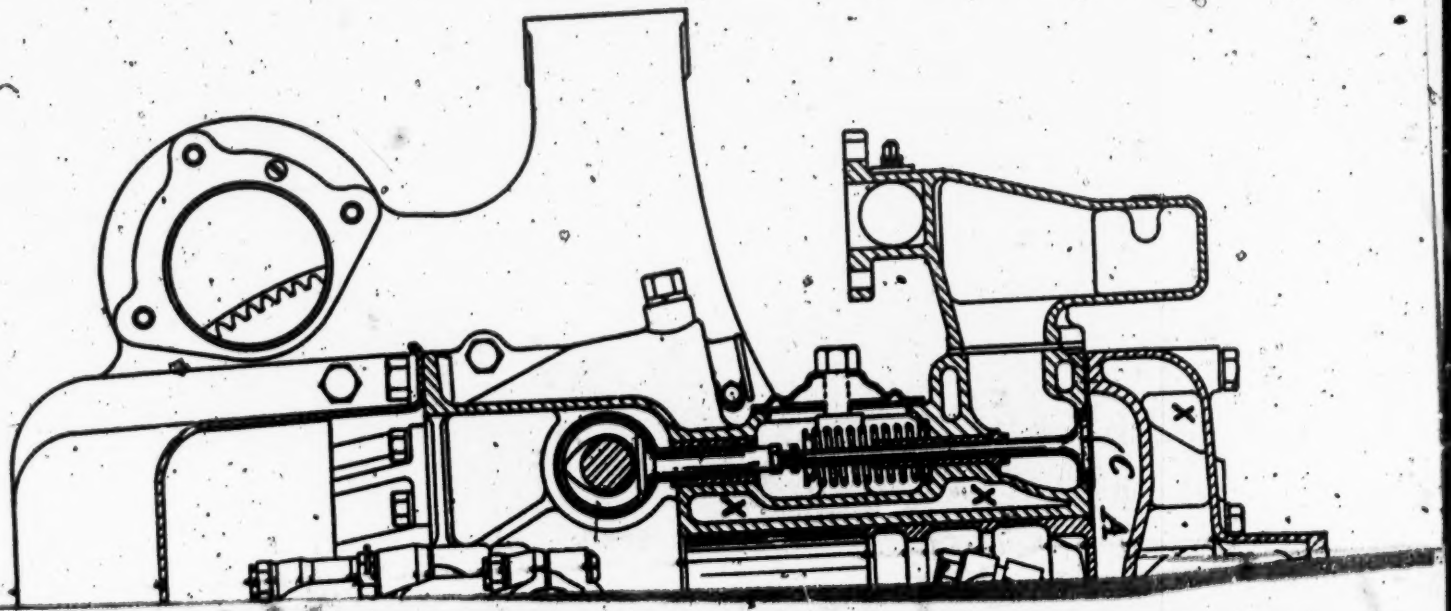
(2) That since the sentence contains the term "split skirt," horizontal flexibility would not only be inherent in the structure, but would be unavoidable. If there could be any doubt about this, other portions of the specification to which we have already referred make it indubitable.

(3) Aside from these things we assume that if it be held that there is an ambiguity in the above quoted sentence, nothing can throw more light upon it than the sentence in the specification next following the one quoted and in which Gulick stated the purpose of the rigidity. This sentence is as follows:

> "The arrangement of the supporting flanges 17 between the ends of the piston pin bosses and the connections of those flanges with the piston provides a particularly strong support for the bosses."

The reader of these two sentences must bear in mind that by far the greatest forces between the piston and the piston rod, and hence between the bosses and the webs or flanges 17, are in the vertical. The explosion which impinges against the top of the piston drives it vertically downward. The force of the explosion is transmitted vertically downward through the bosses and the webs or flanges 17 to the connecting rod and thence to the running gear of the vehicle.

This will be clear from the cross section of an internal combustion engine illustrated in Fig. A opposite page 40 of our Main Brief in the Court of Appeals.



X
X
X

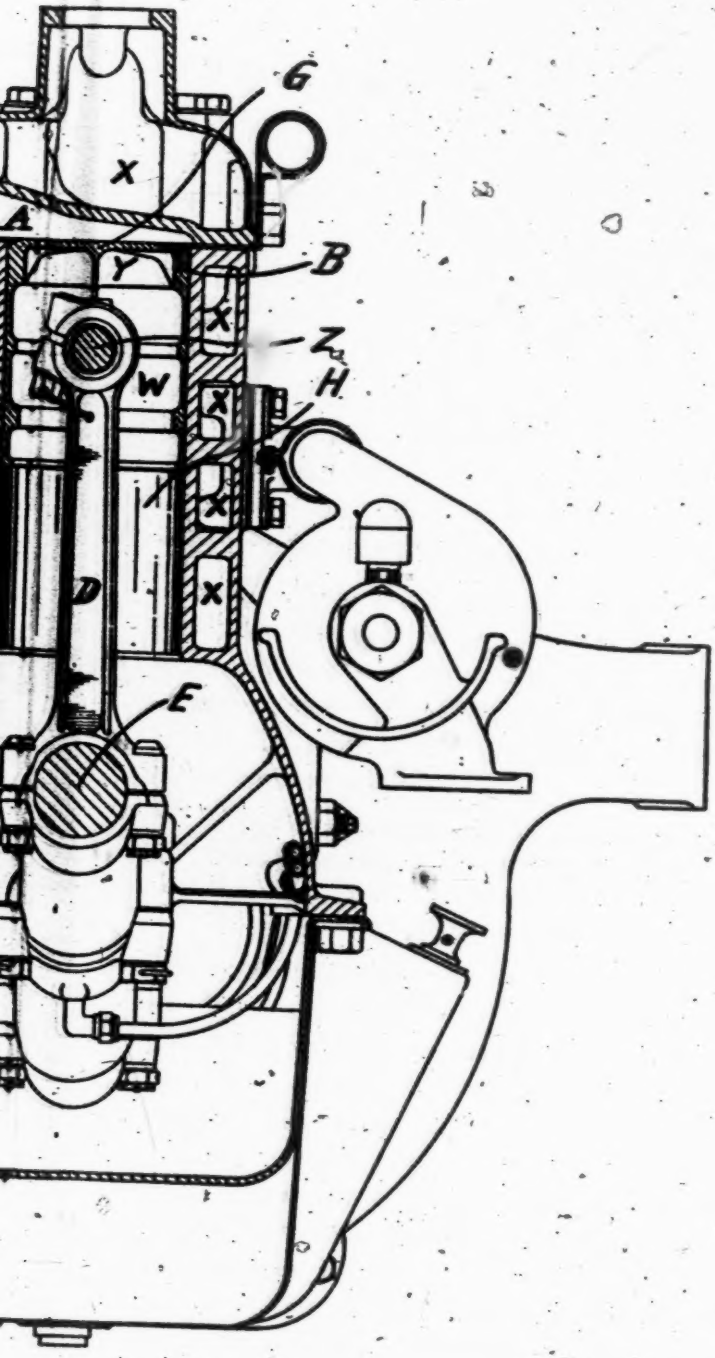


FIG. A

The explosion occurs in the chamber A, impinges on top of the piston head G, drives the same *vertically* downward in the engine cylinder H, as the explosion of the powder in a gun drives the bullet down the barrel of the gun. The piston is connected through a rod D and a crankshaft E with the running gear of the car. As everybody in the art knows *these connections between piston and car gear must be rigid in the vertical.*

In endeavoring to limit the discussion to the property of expansion and contraction of the piston horizontally, petitioners, throughout their presentation of this cause in all of the Courts, have minimized or lost sight of the need of preserving ruggedness and durability in the piston as a prerequisite to horizontal flexibility. The testimony of Mr. Gulick shows that he had these virtues particularly in mind. As the Court of Appeals said (R. p. 2390):

> "While Gulick variously expressed satisfaction with the performance of his experimental pistons, it is clear upon review of his entire evidence that what he had then in mind was that they performed satisfactorily in reference to clearance. They had not demonstrated their strength and durability, or that they were properly designed or machined for commercial use."

When these things are considered it becomes clear that the two sentences which we have quoted are dealing with these essentials which, of course, were predicated primarily upon a rigid connection in the direction of the applied power, i.e. in the vertical between the piston and the connecting rod through the bosses and the webs or flanges. The draftsman of the specification knew that everyone would know that the web or sheet would be flexible in the horizontal. He knew that if the skirt were split there would be no way of preventing the operation of this

flexibility, even if it were desired to prevent it. Those things were known not only to those skilled in the art, but to anyone who knew the properties inherent in a sheet of metal. He also knew that those skilled in the art would be concerned about the preservation of the ruggedness and durability of the piston, at the very bottom of which there lay the question of rigid connection between the piston and the piston rod. The connections between the piston and the piston rod which had been in universal use prior to Gulick's invention, and which were relied upon for rigidity and consequent ruggedness and durability, had been discarded in his piston in order to provide a means which would flex in the horizontal. It was, therefore, important that this feature of vertical rigidity should be described. The horizontal flexibility of the webs was inherent and apparent to anyone skilled in the art. The vertical rigidity of the new piston, however, was not. Hence, we find in the first sentence a reference to this "extremely rigid connection," and in the second sentence a description of its purpose, i.e., the provision of "a particularly strong support for the bosses" which, as everyone who knew anything about pistons could only interpret to mean against the strong vertical forces by which the vehicle was propelled through these connections. All this is borne out and supported by the drawings which show the webs 17 extending almost the entire length of the piston skirt and projected upwardly and downwardly to brace the central part of the webs against forces applied in the vertical.

Many of the opinions of the Patent Office Tribunals were rendered at different times when considering different claims of the Gulick patent. In all, thirteen concurring opinions have been rendered by eight different tribunals. Six claims of the Gulick patent, found valid and infringed, were involved in these long and bitterly contested interferences in the Patent Office and on three appeals from the Patent Office. The long delay in obtaining the Gulick pat-

ent was caused by the persistent efforts of later contenders to wrest from Gulick the rights which the Patent Office and the Administrative Courts believed belonged to Gulick. No appeal was ever taken by Gulick in the Patent Office.

In no instance was any opinion based upon the particular measurements of the Gulick drawings. They were each based upon Gulick's structural arrangement of the elements of his piston and his disclosure that, in addition to the rigid construction for the one purpose, his piston skirt would not "expand against the cylinder wall to such extent as to seize or stick" for the other purpose of maintaining a minimum of clearance between piston skirt and cylinder wall.

Special Proportions of Variants and Special Embodiments of the Patented Pistons: Counsel recognized, and must early have done so, that not only was flexibility inherent in the webs, but that the dimensions of the webs must be varied—not to get flexibility—but to get the degree of flexibility most efficient for each variant. Hence there was considerable cross examination of respondent's expert on the latter question and his answers were in the Court below, and are here, used in such a way that the latter proposition is confused with the first one (see Petitioners' brief, pp. 31-34).

Every important invention is capable of being constructed in numerous designs varying in size, materials and within wide limits in details and dimensions. Into this picture comes the engineer who calculates the strains, the forces, the loads, etc. and proportions the parts of each set of details and dimensions to realize the greatest efficiency in that particular design.

Not only was Dr. Jeffries interrogated on this subject, but special designs, such as the Ricardo piston with the

slippers split, were submitted to him and he did the best he could, without slide rule, engineering tables, etc., to advise counsel on how to proceed to proportion the parts of these designs to apply the Gulick and Maynard principles to them to get the best efficiency.

Attempt is now made to construe this testimony to mean that there is an insufficiency of disclosure because Gulick and Maynard do not do their engineering in their specifications along with their disclosures.

A patentee is not required to do his engineering in his patent; he is not required to do more than disclose a single embodiment of his invention (*U. S. v. Societe*, 224 U. S. 328).

It does happen that Maynard did do his engineering in his patent as well as in his disclosure since, as the record shows, millions of pistons exactly like shown in his patent drawing were successfully used in commerce. (R. pp. 462, 471, 68, 955, 1050 and 1328.)

The Gulick patent does likewise, since, as the record shows (R. p. 699), Gulick was a skilled engineer and the Gulick patent drawings disclose an experimental piston designed by him to get the best results for that design. (R. pp. 719 and 1363.)

What would be the best proportions to be given the parts of other variants, such as the Ricardo piston with the slippers split, can have no bearing on the disclosures of the patents in suit or the issues here. A proposition that a patentee must not only do his engineering in his specification, but must do it for all the variants on the embodiments he discloses would be asking the impossible, and to contend that his patent is invalid because he does not do so is not only unreasonable, but contrary to all authority and all practice.

Yet the Master was confused by this contention; Judge Simons was not.

PETITIONERS' POINT II.

The Circuit Court of Appeals did not treat the Maynard webs as essential elements, but merely as elements of the combination illustrated in the Maynard patent as the preferred form. That Court did not undertake to read "flexible webs in the region of the wrist pin bosses" as essential elements or as, in fact, any elements at all in the Maynard claims which recite webs without any such limitation as petitioners assert. In asserting that Maynard used flexible webs in the piston which he illustrates as his preferred form, the Court of Appeals relied upon the commonly known fact that the webs were flexible in the horizontal and the testimony of the petitioners' expert, as well as that of respondents' expert, to the effect that they would be inherently flexible to common knowledge.

Point II, made and discussed by the petitioners at pages 35-38 of their brief, is different from Point 2 at page 15 which seems to be its Point III discussed beginning at page 38. We will follow the discussions under the order of the Roman numerals.

Under this title (Point II) petitioners try to read into the Maynard patent in issue and into the cause, a feature not recited there and unimportant to any legal issue or to the operations and results of the pistons. So long as the webs are flexible it does not matter that they are not so in "the regions of the wrist pin bosses." Whatever is true of the Maynard piston in this regard is true of the defendant's construction except, perhaps, in degree, as petitioners' expert repeatedly testified (R. pp. 566 and 581), as respondent's expert affirmed (R. pp. 122-125, 127, and 953-955) and as the attached drawings conclusively exhibit. (See page 52 of this brief.)

Moreover, as the evidence we have cited shows, both pistons have flexible webs and both webs are flexible in "the regions of the wrist pin bosses."

The second question discussed by the petitioners under the title "Point II" relates to the rule that a patentee is not required to give directions as to how to design pistons embodying his invention in its various applications. This question was also discussed by petitioners under Point I and our reply will be found at the end of our preceding chapter entitled "Special Proportions of Variants and Special Embodiments of the Patented Pistons."

No Finding of Fact was proposed to or adopted by the Master* that had the slightest bearing on the sufficiency of the disclosure of either the Maynard application as filed or the patent as issued.

Nowhere is there any evidence that the Maynard patent in suit was insufficient to teach those skilled in the art how to make and use the invention of the Maynard patent.

PETITIONERS' POINT III.

The evidence of the petitioners' experts alone was sufficient to justify the Court of Appeals in finding that the aluminum piston problem was solved by the patents in suit and that the commercial success of the aluminum piston was due thereto.*

---

* All findings and conclusions on the merits were proposed by Petitioners and adopted by the Master without change.

* R. pp. 458-462, 464, 465, 467, 468, 469, 471, 478, 479, 481, 528, 529, 531, 535, 537, 540-548, 551-555, 560-563, 566, 567, 568, 572, 573, 574, 577, 578, 581, 582, 587-589, 1073, 1074, 1077, 1079, 1080, 1081 and 1082.

CONFLICT BETWEEN MASTER AND COURT.

There has been no violation in this cause of the rule in *Adamson v. Gilliland* (242 U. S. 350) either as announced by this Court or asserted by petitioners. The points upon which the Court of Appeals differed with the Master were points (1) upon which there was not a scintilla of evidence to support the Master's finding, (2) law points, and (3) points on record evidence.

The question of sufficiency of disclosure is one based on the records and in such case there is no presumption in favor of a finding of a Master or a District Judge; indeed, the Court of Appeals was much better equipped, because of Judge Simons' experience in such matters, to come to a just conclusion on this subject on the record than either the Master or the District Judge. If the testimony of the two experts to the effect that the webs would inherently be flexible is to be considered then, since they are in agreement, there is not a scintilla of evidence to support the Master and the District Judge on this subject.

The extensive commercial use of the precise piston illustrated in the drawings of the Maynard patent was testified to by Mr. Stellman, petitioners' expert, as well as by Dr. Jeffries, the expert for the respondent.

Mr. Stellman said (R. pp. 462 and 471):

"In general design, the pistons that were furnished by the Aluminum Company, Bohn and Kant Skore, to manufacturers, were like that shown in the drawing of the Maynard patent 1,655,968, in this suit, but I don't know that they were slotted like that. I know that that piston shown in the drawing, and commonly known as a split skirt piston in the industry, was used in quantities since around 1921."

"I can't tell you when I first saw pistons like shown in the Maynard patent, with the slot. I should say they have been on the market, with the slot in them, for a number of years, and in wide use, not only for replace-

ments, but in production by a number of automobile companies."

(See also R. pp. 68, 71, 77, 78, 81, 88, 130, 132, 135 and 955.)

There is not an iota of evidence to the contrary. Counsel have made the mistake of asserting the contrary so often that it may by now be classified as self deception, especially in view of the effort to drag a herring across the trail by reference to Dr. Jeffries' testimony regarding a slight variant with the inference, if not the suggestion, that there is no other evidence on the subject. (Petitioners' brief, p. 41.)

That it is the rule that a patentee may rely for commercial success upon embodiments of his invention other than those illustrated in his drawings, as well as the latter, does not daunt petitioners, who insist that every patent must be limited to what is specifically illustrated and not then unless every property of every part is described in the specification as well. Courts are not so harsh even with criminals; certainly public benefactors are entitled to a more liberal treatment. Presuming that such a harsh rule will be adopted by this Court against all preceding holdings, counsel says that the Gulick piston was never used commercially. That is like saying that none of Alexander Graham Bell's telephones were ever used. About a hundred million Gulick pistons were used in the sense that Dr. Bell's telephones were used.

Whether or not Maynard advanced the art is a legal conclusion and no presumption favors a Master's finding on that subject. Since Maynard illustrates a piston made by the millions and which petitioners found it necessary to duplicate to succeed in the commercial field (R. p. 1074), the legal conclusion of the Court of Appeals is correct.*

---

* The commercial success of the piston covered by the patents in suit was due neither to "strong hands" nor to what petitioners

(Continued on page 51)

There is not a bit of evidence to support the Master's conclusion that Maynard embodies the fundamentals of Franquist. Even the evidence of petitioners' expert is to the contrary. (R. pp. 528, 552 and 1078.)

Whether or not Maynard's combination of elements is a patentable combination is a legal conclusion with no presumption favoring the Master's finding. The finding of the Court of Appeals on the question is bottomed on decisions in this Court. (*Webster v. Loom Company*, 105 U. S. 580; *Expanded Metal v. Bradford*, 214 U. S. 366; *Consolidated v. Diamond*, 220 U. S. 428.)

Whether or not defendant's piston, Exhibit 1, embodies the invention of Gulick and Maynard is also a legal conclusion. We do not discuss it further since it is admitted in petitioners' brief that the question of infringement is not here involved. (Petitioners' Brief, p. 17.)

No evidence supports the claim that defendant employs "the essential structure, function and mode of operation" of a prior art device. Even petitioners' expert repudiates that assertion. (R. p. 567.) Any finding of the Master to that effect is not only not supported by any evidence at all, but such would be a legal conclusion and entitled to no favorable presumption.

We presume that we must say something about the "Keystone relief" mentioned so often in petitioners' brief, though this feature is not only misnamed by petitioners, but both with its proper and its improper name relates to details immaterial to any issue in the cause. It is not in-

---

(Continued from page 50)

refer to as "the 'selfish' type." It was not due to any causes mentioned by this Court in *Mineral v. Magma*, 280 U. S. 400, or *Textile v. Louis Hirsch*, 302 U. S. 499, but resulted, as the Court of Appeals said, from overcoming the "black eye" given the aluminum piston by prior efforts and failures which were overcome only after tests on the patented pistons were made by engineers of internal combustion engine manufacturers who were, by such tests, convinced of the merits of the patented pistons and of their solution of the problem. (R. p. 2383.)

cluded in any claim in suit; it does not affect any mode of operation or any result of any piston involved here, except perhaps in degree, which is immaterial.

An examination of the drawings of the Maynard patent and Exhibit 1 on the opposite page of this brief will show that the edges of the reliefs shown at Y are slanted downwardly and inwardly to form a frustrum of a triangle commonly known as a Keystone. Whether the edges are so inclined or not is immaterial. The evidence shows that these sides may be vertical as in Exhibit 21 (R. p. 1337) or they may be inclined downwardly and outwardly as in the piston of the Jardine patent (R. p. 1294), without any change, except in degree. The record also shows that some users of the Maynard piston, largely for psychological reasons, objected to what appeared to be sharp edges on these Keystone reliefs in the original Maynard design. Hence they were trimmed off as shown in Exhibits 17 and 1. No doubt because of the insignificance of this change structurally, as well as in operation and results, counsel have sought to give it importance by borrowing the term "Keystone relief," employed for the Keystone relief to which we have referred notwithstanding the trimming of the edges resulted only in the removal of a triangular section and left a triangular surface where the sharper edge had been. Since the edge part removed in no way affected the principle or functions of the Maynard piston, the removal of this little triangular section did not do so either. (R. pp. 80-86, 190, 191, 199, 200, 201, 566, 581, 955, 956 and 957.) Yet this is the kind of thing that makes the hue and cry pervading this cause.

We have elsewhere in this brief discussed the "patent pool" question to which the petitioners return in the chapter entitled "Point III" and we will not discuss that subject again except to say that there is no evidence in this record to support the claim that "actually at the end of 1926 there was complete control of the aluminum piston

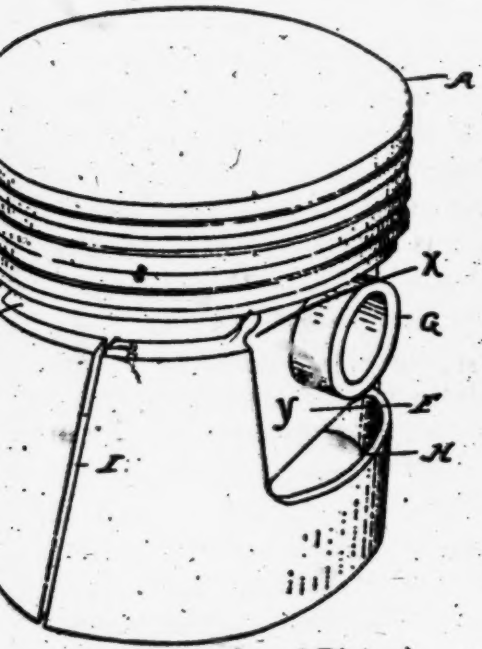

Fig. 1 (Maynard Piston)

Fig. 2 (A Piston of each Plaintiff and Defendants)

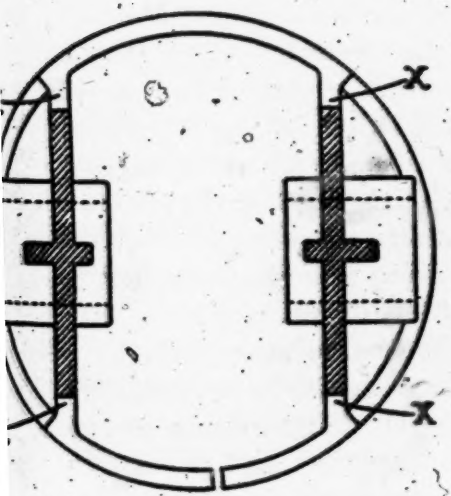

Fig. 3 (Maynard Piston)

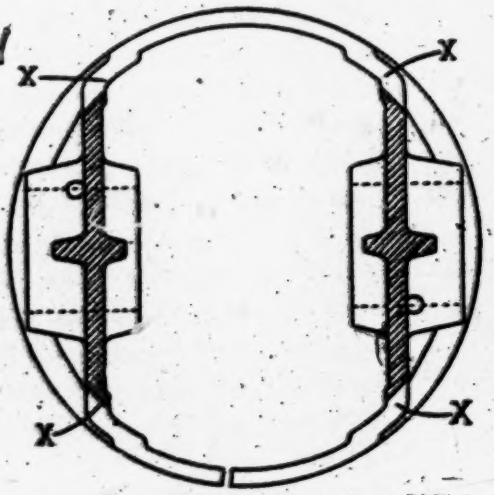

Fig. 4 (A Piston of each Plaintiff and Defendants)

business in Aluminum Company of America," since as the record shows there were several licensees under the patents here in suit and as the Patent Office records would show there are a number of aluminum piston designs covered by patents, not owned by the respondent or the Aluminum Company, available to those who would engage in a business not infringing the patents in suit. Indeed, this record includes many such patent said by petitioners to disclose excellent piston designs. (R. pp. 1667-1681, 1694, 1702.) Inconsistent is the contention that all the patented pistons are uncommercial, yet by them the aluminum piston business is monopolized. The truth lies between: the patents in suit disclose and cover commercial aluminum pistons; other commercial designs are available to the petitioners, but they want to duplicate the designs of the patentees' licensees, and have done so for years.

The Long Pistons were used in very limited quantities in the replacement trade and to some extent in a special air-cooled engine; except for a few more or less experimental pistons all were made from castings licensed under the patents in suit and were, therefore, under the patents in suit. (R. pp. 387, 461, 462, 940 and 986.) As one of petitioners' witnesses said, the use was a "mere drop in the bucket." (R. p. 399.) Long did not solve the piston problem for many reasons. Because of his defects the pistons of the patents in suit prevailed over the Long pistons in both its uses. (R. pp. 216, 359, 399, 455, 463, 986, 1438, 1587.)

Gulick preceded Long as all the Patent Office Tribunals and the Court of Customs and Patent Appeals found in completely contested interferences between the two (17 Fed. (2) 686; 47 Fed. (2) 369).

All engine makers, except the maker of the air-cooled engine to which we have referred, recognized that the Long piston was not a solution of the piston problem and rejected

it; later these same makers adopted Maynard. It was the installation of such pistons as the Long piston in private cars by garage mechanics that gave the aluminum piston the "black eye" referred to by the Court of Appeals (R. p. 2383), and which made it necessary to restrict the licenses under the patents in suit to reliable makers of pistons.

In any event, the conclusions about the limited success of Long's piston and the failure of the industry to recognize it as a solution of the piston problem are conclusions where no presumption favors the Master's finding.

Elsewhere in this brief we have discussed "intervening rights" and the Long piston.

The Court of Appeals did not base its finding of commercial success on the licenses taken or the royalties paid under the patents in suit, but on the evidence of the making, selling and successful use of a hundred million such pistons.

Licenses and royalties are evidence upon public recognition.

There is no truth in the assertion that respondent ever represented that Franquist or Spillman & Mooers were responsible for the success of the aluminum piston; all the evidence is to the contrary.* Petitioners bought these two patents, but never made any such representation regarding them. Even if such representation had ever been made, it could be of force only in case it had been shown that the petitioners had acted upon the same and there was consequently an estoppel forbidding respondent to assert the truth which is, as both experts agree, that the Gulick and Maynard inventions are not found in Franquist or Spillman & Mooers. (R. pp. 528, 529, 554, 563 and 567.) On this sub-

*R. pp. 111, 177, 178, 201 to 205, 246, 247, 496, 528, 537, 555, 929, 943, 944, 1040, 1041, 1052, 1053 and 1078 as to Franquist, and 102, 109, 167, 195 to 198, 373, 458, 553, 555, 562, 563, 567 and 573 as to Spillman & Mopers.

ject there is not a bit of evidence to support a contrary finding; moreover, any conclusion in the premises is a legal conclusion.

Other Outstanding Errors in the Petitioners' Brief: Many of the record references cited by petitioners to support their assertions are to the Master's report; this is because there is evidence to support neither the petitioners' assertions nor the Master's report. For example, there is not a scintilla of evidence to support the assertion or the holding that the Gulick and Maynard pistons never went into commercial use. Even petitioners' expert testified to the contrary, as we have said. (R. pp. 462 and 471; see also pp. 68 and 955.) When the testimony of respondent's witness, at pages 462 and 471 of the record is read, the error of the statement at pages 14 and 41 of Petitioners' brief, that the only evidence on the subject is that of plaintiff's expert, is clear.

Another like error is the statement that—

> "Before they expired Respondent represented that the pioneer Spillman & Mooers and Franquist patents were responsible for the success of the aluminum piston." (Citing the Master.) (See Petitioners' Brief, p. 10.)

The extravagance of this statement and the errors in the statement at the top of page 11 to the effect that respondent was "relying upon those patents (Spillman & Mooers and Franquist) as dominating flexible aluminum pistons" are plain from the undisputed evidence showing that neither Spillman & Mooers nor Franquist was commercially flexible. (Petitioners' expert, R. p. 562; Respondent's expert, R. pp. 108, 109, 164, 165, 195-199 and 684.)

We think it fair to assume that patents on unsuccessful devices precede the patent on the successful device or devices, and that some of these preceding patents contain

broad claims. Fifty-seven such patents preceded McCormick's successful reaper and the Wright brothers were preceded by a host of patents on flying machines that never left the ground. And so Spillman & Mooers and Franquist preceded Gulick and Maynard.* To avoid suits, which had been threatened and, under Franquist, actually instituted against one of respondent's licensees, these two patents were bought and incorporated in the group, and being there, were included in the licenses issued and the suits instituted prior to their expiration. But no suit including them was ever tried and no representations were ever made that they were successful or responsible for the success of the aluminum piston. They were so unimportant that when they expired no licensee asked for a reduction in royalties which any licensee might have done had either patent been important. Moreover, the Spillman & Mooers patent expired in 1931 and the Franquist patent expired in 1932. Yet the Sterling Company persists in copying, to their minutest detail, each of the designs of the respondent's licensees in lieu of adopting the now free and open designs of Franquist and Spillman & Mooers. To use the language of Mr. Justice McKenna, speaking for this Court in *Diamond v. Consolidated*, 220 U. S. 428, 441, "It gives the tribute of its praise to the prior art; it gives the Grant tire" (i.e. the patented device) "the tribute of its imitation." Important inventions do not spring full-fledged from the brow of an art; they are always preceded by prior efforts and failures, some of whom succeed in getting patents. Often it is wiser

---

* The Court of Appeals said (R. p. 2387):

"There was much research and experimentation by those most highly skilled, including the engineers of the Aluminum Company. Colonel Vincent of the Packard Motor Car Company, one of the designers of the Liberty engine, and the engineering staff of the Franklin Automobile Company, under the direction of the defendants' expert Stellman, its chief engineer."

to purchase than to fight such patents, and having been purchased, the licensees feel more secure if their licenses include them for the same reason.

In any event, this record shows neither Spillman & Mooers nor Franquist was a success as an aluminum piston; quite the contrary. (R. pp. 177, 203, 204, 247, 249, 250, 254, 458, 462, 496, 528, 536, 540, 934-944, 1044, 1052, 1074, 1077, 1079, 1080.) Therefore, even if respondent had been mistaken and represented either to be so, no estoppel exists which closes respondent's mouth to speak the truth now and petitioners cite none.

Nor is there any correctness in the statement that the success of the aluminum pistons made under the patents in suit was ascribable to "the advent of the permanent molding of aluminum pistons in 1915." Efforts to use pistons involving the permanent molding inventions in pleasure automobiles failed from 1915 to the advent of the Maynard piston about 1922 (R. pp. 183-184) for the reason that such pistons slapped when cold (R. pp. 125, 400, 460) and stuck when hot. (R. pp. 73, 74, 478, 479.) These failures were affirmed by petitioners' expert. (R. pp. 546-548; see also R. pp. 256, 257, 458, 459, 460, 462, 466, 467, 471, 528, 539, 540, 544, 546, 547, 548, 554, 555, 563, 567, 588, 589, 994, 1077, 1079, 1080, 1761, 1763, 1828, 2235, and 66 Fed. (2) 964.)

We were asked to make suggestions on the Master's report only to questions in keeping with the Master's views. Inasmuch as all suggestions we had to make were contrary to his views (R. p. 1274)—as are the holdings of the Court of Appeals—we made none, and we see no reason why we should have been expected to do what he asked us not to do, for even if it is usual for a tribunal to consider a petition for a rehearing, lawyers do not like to present such a petition when specifically asked not to do so. Thus the usual opportunity to point out errors of a tribunal were denied petitioners by the Master.

Counsel say (Petitioners' Brief, p. 42) "that all Maynard did was to put the T-slot of Long on the piston of Schmiedeknecht." If that statement were correct, and such were the limits of Mr. Maynard's achievements, he would have produced a new combination of elements operating in a different way and achieving new results and such is the evidence supplied by petitioners' expert. (R. p. 563.) *

But Maynard did much more. He located the slots in the right place and he omitted the features of Long such as the U-slot (R. p. 1728), the six-sectioned skirt (R. p. 1736), and the half webs. (R. p. 1732.) Maynard caused the piston to expand and contract to conform to the engine cylinder during the life of the internal combustion engine which neither Schmiedeknecht nor Long ever did. (See Petitioners' expert, R. p. 458.) The evidence is that four or five-thousandths clearance is too much for success; two-thousandths is the limit. (Petitioners' expert, R. p. 460.)

Pursuant to the practice of relying for their contentions on the Master's finding, because the evidence is contrary to both finding and contention, we find the petitioners quote the Master's finding 51 at page 44 of petitioners' brief as follows:

---

* Such a change in the prior art will not be tolerated (*Topliff v. Topliff*, 145 U. S. 156.)

Such a combination is patentable (*Expanded Metals v. Bradford*, 214 U. S. 366). The Court of Appeals said (92 Fed. (2) 334):

> "But to combine insulation of head from skirt, retraction of the bosses from the skirt periphery, connection of such bosses to the skirt with webs laterally flexible and yet so carried from the head as to support the load upon the wrist pin with sufficient strength and rigidity, and to utilize the mechanical force of the cylinder wall upon the skirt and the thermal expansion of the bosses so as to compensate evenly and fully for head expansion and to secure a balanced flexibility of the skirt with no bending concentration at any point therein, discloses, we think, a meritorious concept beyond the reach of those skilled in the art."

"(51) 'That defendants' pistons, Ex. 1, employs the essential structure, function and mode of operation of the prior art, more particularly the Franquist patent, No. 1,153,902.'"

Even defendant's expert testified contrary to this statement as follows (Exhibit 21 is the same except for immaterial details with Exhibit 1 and Exhibit 3-Q was a piston produced by petitioners as a Franquist piston) (R. pp. 552 and 553):

"Q. The ribs in the heads, you mean? A. These ribs here. There is no slot in the skirt—oh, yes, there is a slot shown on one side. In other words, it is a piston somewhat similar to Exhibit 1; is that right?

"Q. Yes, my understanding of it. Now that you have seen the slot in there, do you still say it would be too stiff? A. I would say it would be a pretty stiff piston at that.

"Q. Do you think that would be as stiff as this Exhibit 3-Q? A. Well, Exhibit 3-Q is a different design. It might not be stiff in the same places.

"Q. In what way is it different; in what way is 3-Q different from the one shown in 21? A. Well, these slots, these four slots in the surface, that has one. This has the wrist pin bosses supported by the skirt, and this has them supported by the webs. And the skirt is made with a small relief on this, and made with a large relief on that. The two pistons are not similar in design.

"Q. Well, do you say—I asked you about the stiffness—do you say they have a different kind of stiffness? Why do you say they would have a different kind of stiffness—because of the differences in design that you point out? A. Yes.

"Q. Do you find any other differences in them than those you have mentioned; I mean in design, structure? A. Oh, the only thing common is that the thrust surfaces of the piston are separated from the head."

Although unimportant to any issue here, it was incorrect to say as petitioners do (see petitioners' brief, p. 3)

that the Bohn Corporation agreed to "pool all patents relating to pistons *per se*." The Bohn Corporation never has assigned to respondent any interest in any patent issued to them on their own developments of which there are many.

"The Gulick flexibility is gained," says the witness quoted by petitioners at page 22 of their brief, "by flexible webs and flexible skirt and cooperation between horizontal and vertical slots." (R. p. 203.)

The proofs show that the piston Exhibit AAA comes within the patents in suit. (R. p. 86.)

The diagram at page 10 of petitioners' brief is misleading; if correct, it would present merely the overlapping grants on early and improvement inventions. It shows that Spillman & Mooers patent expired in 1931 and Franquist in 1932, showing that if what petitioners or the Sterling Company really wanted was to make aluminum pistons and not duplicate the respondent's licensees' commercial designs as fast as they came upon the market, which they have done in the past, these people could go back to Franquist or Spillman & Mooers, which they represent as excellent pistons.

ADAMSON v. GILLILAND AS AN ABSTRACT RULE.

The expression by Mr. Justice Holmes in this opinion to the effect that (under certain circumstances) the Master's report should be "treated as unassailable" has led to some confusion in the lower courts. We take it to be generally understood that, for the very purpose of putting an end to such confusion, this Court adopted general equity rule 61½, which rule is repeated and confirmed in the new Federal rules of 1938 by rule 52. Since the adoption of that rule (61½) there is obviously no force in contending that the Master's report or the finding of the trial judge has any effect excepting as that effect is carefully stated and limited in that rule. The Circuit Court of

Appeals for the Sixth Circuit has always adhered to that view of the Master's report which this Court, by the adoption of rule 61½, made obligatory upon all the lower courts.

The history of the "unassailable" doctrine justifies attention. It had its first formulation in *Davis v. Swartz*, 155 U. S. 631-636. The formula, as it was there stated and applied, was perfectly accurate. The court, on pages 636-7, points out that the Master, whose finding was under review, had been appointed not as the ordinary Master, but in effect as an arbitrator. This conclusion was reached by review of *Kimberly v. Arms*, 129 U. S. 512, where it had been determined that the circumstances of his appointment made the Master an arbitrator, and by concluding that the Master's appointment in *Davis v. Swartz* was of the same character. Having reached this conclusion, the court of course said that the Master's finding was as unassailable as is that of the verdict of a jury, or that of a finding of a federal trial judge without a jury. In other words, the rule applicable to reviews at law was applied in this case, because the court did not have the normal powers of an equity appellate court.

The next case is *Adamson v. Gilliland*, 242 U. S. 350. This opinion was by Mr. Justice Holmes. The question was as to the validity of a patent and, upon a sharp issue of fact, as to whether the patentee was the prior inventor. The trial court, upon conflicting testimony, had found that he was. The court quoted from *Davis v. Swartz* this "unassailable" formula. It did so after pointing out that the anticipator must prove his case beyond a reasonable doubt, and that the trial court, acting under this rule of law, had decided the issue against the anticipator. The formula was perfectly and properly applicable, because, if the finding of the trial court against the anticipator is supported by substantial testimony, it obviously cannot be true that

the anticipation has been proved beyond a reasonable doubt.

It is plainly quite another thing, and not supported by *Adamson v. Gilliland*, to apply this same formula to a finding by a trial judge that the anticipation has been established. Such a finding is entitled to great respect, but if, upon the evidence, it is clearly wrong, it cannot be "unassailable." So to consider it would be to deprive the Court of Appeals of the power to consider and apply the rule that such a defense must be proved beyond a reasonable doubt.

These two cases are believed to be the only ones where the Supreme Court has stated and applied this rule,* and neither one of them supports the theory that the appellate equity federal court is under any obligation to accept the fact finding of the trial court when that finding is against the clear weight of the evidence, or is not supported by the burden of proof which the law requires, or is for any other reason a clear mistake.

It would indeed be a sad commentary on federal jurisprudence if, in this case, the so-called fact conclusions of a Master, dependent on all conceivable questions of patent law and overruling a dozen decisions of the Patent Office and District of Columbia courts, and then adopted *in toto* by the District Judge, who heard no oral argument and rendered no explanatory opinion, thereby became a bar to any intelligent and careful consideration by the Sixth Circuit Court of Appeals.

---

* In *Corona v. Dovan*, 279 U. S. 358, 375, the court referred to this rule as "claimed," but neither discussed nor applied it; and in *Alabama Co. v. Ickes*, 302 U. S. 464, 477, it was said that findings by the District Court which had passed unquestioned by the Circuit Court of Appeals, would then be so accepted by this Court.

PETITIONERS' POINT IV.

The Court of Appeals was justified in concluding that the presumption of validity of the Gulick patent in suit was strengthened by the interference contests in the Patent Office under this Court's decision in Radio v. Radio and Hildreth v. Mastoras, and that both presumption and support were further supported by many prior efforts and failures, some of which were testified to by petitioners' expert and by general adoption after tests by automobile engineers, etc. There is no error in overruling the Master and the District Judge on these questions because there was not a scintilla of evidence to support the conclusions of the Master and the District Judge where the Court of Appeals overruled the Master and the District Judge on fact questions.

As the Court of Appeals said, any presumption that normally arises to favor the finding of a District Judge "may prove to be an unsafe guide to just decision where exceptions to a Master's report are unilluminated by oral arguments and a decree entered without elucidation of the reasons upon which it is based" (R. p. 2389.) This refers to the scant attention the District Judge was able to give the cause due to the press of other matters, which was also the cause of the reference and respondent's application therefor, the alternative of which was no trial at all in view of such press of work.

This lack of illumination and attention is at once manifest when we note that the Court of Appeals relied upon this Court's opinion in *Radio v. Radio*, 293 U. S. 1, and the District Judge was unable to note that there were in the instant cause the same lengthy and contested interference proceedings and appeals that were present in the cited case and which this Court ruled, in the cited case, greatly

strengthened the presumption of validity.* The careful scrutiny of the Court of Appeals is a safer guide to a just decision than haste and oversight due to overwork that misses matters so important to a just decision.

We will not here repeat the evidence found by the Court of Appeals to sustain the presumption of validity strengthened as it is under the rule of this Court in *Radio v. Radio*; the Court of Appeals ably discusses and applies it. (R. pp. 2387 and 2388.) The facts upon which it is based are undisputed; the salient facts are affirmed by petitioners' expert. (R. pp. 216, 256, 257, 359, 363, 364, 398, 399, 401, 429, 444, 455, 458, 461, 462, 464, 469, 528, 546, 547, 548, 553, 554, 567, 642, 937, 938, 986, 1010, 1011, 1089, 1438, 1587, 1728, 1732, 1753, 1761, 1828 and 2235.)

Alleged Broadening of the Gulick Application After Intervening Rights Arise:

This contention does not, of course, apply to Maynard.

It cannot apply to Gulick either because his patent claim 1, one of the broadest of Gulick's claims, was included in the application as filed and has remained in the application without change ever since. (R. pp. 1840, 1565, 1570.) The Court of Appeals found that this claim was infringed by Petitioners' Exhibit 1 piston. (R. p. 2395.)

The "intervening rights" were not such as accrue to any of the petitioners here and are not claimed to so accrue. There is, therefore, no estoppel in favor of any of these petitioners to assert that a claim broader than claim 1 was

---

* See R. p. 2385:

"There followed long discussions with the examiners, administrative reviews, bitterly contested interferences, and appeals to the Court of Appeals of the District of Columbia (*Long v. Gulick*, 57 App. D. C. 98, 17 F. (2d) 686), and to the Court of Customs and Patent Appeals (*Hartog v. Long*, 47 F. (2d) 369)."

inserted after said intervening rights if such a broader claim than claim 1 had been inserted.

All the alleged intervening activities, called "intervening rights" by petitioners, were the work of the respondent's licensees, including even the pistons of Long which were made of castings licensed under the patents in suit. (R. p. 940.) There is no evidence in this record that Long made, sold, or used, within the period complained of, any commercial pistons other than those which were licensed under the patent rights in suit here.

We know of no rule which permits an infringer to take advantage of a patentee because of alleged "intervening rights" which consisted of the activities of that patentee or his licensees. Counsel cite, and can cite, none. The same applies to a claim that a patentee may not broaden the subject matter claimed because he or his licensee may have been commercially active in the meantime.

We recognize the rule that a reissuer of a patent may not broaden his claims against one who has acquired "adverse intervening rights" himself, but that rule is not applicable here because (1) the principle upon which it is based is not here present, (2) there was no broadening of subject matter claimed and (3) the alleged intervening rights were not by any petitioner but were licensed under the patents in suit.

The fallacy of petitioners' position is reflected in the last sentence of its section Point IV (see petitioners' brief, p. 52):

> "The question was not whether invalidity was shown 'by clear and cogent evidence,' but whether, as a matter of law, a patent is valid which does not disclose, describe or discuss in its specification *an element* found to be essential."

This would be forcible if "an element" had been omitted from the original disclosure, but the element, i.e.

the web, is not omitted; it was originally included in each the drawing, the specification and in claims of each of the patents in suit. It is a description of an inherent property of the material of the web, i.e. flexibility, that was omitted. This statement shows, as we have contended throughout this brief, that petitioners' claim that the disclosure omitted an element—which is fatal to a patent claim under the law * —is in effect a claim that there is omitted only the mention of a property inherent in the material of the element and known to be so by every novice in the industry and which the law does not require be included. Thus does the final sentence of petitioners' brief point the error of petitioners' contention.

The Plates in the Back of Petitioners' Brief: The cuts illustrated opposite page 61 are an invitation to make comparisons by the eye without the understanding. Nothing could be more misleading where similarities and dissimilarities are bottomed, as here, primarily, upon an understanding of operations and results. The cut illustrating the Franquist piston does not show the rigid gutters under the slots which alone destroyed any possibility of this piston being a solution of the problem. (R. pp. 177, 246, 249, 496, 537, 540, 558, 943, 944, 1078.)

The legend "Long 1917-1926" above the cut in the center of the page is incorrect and misleading. The production by Long of such a piston as there shown prior to the filing date of either Gulick or Maynard is not established in this record. The evidence shows that Long made many efforts to solve the piston problem (R. p. 429), but was, as late as 1919, still short of the piston shown. (R. p. 1736.)

---

* The fatal effect would apply only to the claims which included the omitted element since the disclosure without a recitation of the element would support claims not reciting it (*Boyce v. Stewart-Warner*, 220 Fed. 118, 123, C. C. A. 2).

The first drawing of the Long piston here illustrated is dated February 20, 1923. (R. p. 1592.) The oral evidence as to the date of the first use of this Long piston is clearly insufficient under the rule in the *Barbed Wire Case*, especially where, as in the instant case, the witnesses were so carefully "horseshedded" in advance by opposing counsel.*

The cuts showing the Schmiedeknecht piston do not show (as is true) that it is rigid in all of its parts, or (as is true) that the structure would fall apart if slit and split in the manner proposed by Gulick. Petitioners in the Court below contended that Schmiedeknecht did not embody what is shown in Exhibit 1 (and *ipso facto*, by what is shown in the Maynard piston, since, as can be seen from the cuts, one is a duplicate of the other).

As we have said, in this brief we cannot go into the testimony pointing out the differences between these prior art pistons and the patented and defendant's pistons, on the one hand, and the similarity between the patented pistons and the defendant's piston, on the other hand. Neither question is presented in the Points of the Petition for Certiorari or of the petitioners' brief. Within the limits of this brief we can only point out the danger of being deceived by what the eye sees alone, and the necessity of feeding the understanding as well as the eye before a just decision on these similarities and dissimilarities can be

---

* For example, see R. p. 358:

"Mr. Bruninga told me a couple of days ago that I would be called as a witness, and I had a discussion with him at that time, but not about what I was going to testify to. He asked me a lot of questions and I believe he wrote down the answers. I believe it was this morning that he mentioned that I might be interviewed by Mr. McCoy or by you, (Richey), or by somebody representing the other side. *He told me to tell you that I would be glad to answer any question for you, on the witness-stand, of one of you interviewed me.*"

See also R. pp. 408 and 320.

made. Such a course was followed by the Court of Appeals as Judge Simons' opinion clearly shows.

The cut at page 5 of petitioners' brief does not clearly show the vertical slot. A complete view of this piston is shown at page 1284 of the record.

The Patent Pool and the License to Aluminum Company of America: Although quite immaterial to any issue in this cause, and entirely aside from these "reasons relied upon," the petitioners discuss at length—both apart from and in connection with other subjects—"the patent pool" and, wherever counsel thinks there is an opportunity to do so, they drag in the name of the Aluminum Company of America, one of the non-exclusive licensees under the patents in suit. This discussion can have no other purpose than to seek to unbalance the scales of justice by appeals to ancillary questions.

First: Both questions were presented to the Master who ruled against the petitioners on each; petitioners took no exception. (See Finding of Fact No. 9 and Conclusions of Law, Nos. 1, 2, 3, 4, and 9 of the Master, R. pp. 1097, 1105 and 1106.) Under well established authority, there the matter does and should end.

Zellerbach v. Helvering, 293 U. S. 172, 182, 79 L. Ed. 264, 270.

Second: Neither the establishing of a patent pool—if, in fact, any such exists here—nor the granting of a license to Aluminum Company of America under the patents in suit constitutes a defense in a patent infringement suit. (*Walker on Patents*, Sixth Edition, pp. 16 and 17; *Oil Cracking Case*, 283 U. S. 163; *Kardo v. Adams*, 231 Fed. 950; *Trico v. E. A. Laboratories*, 49 Fed. (2) 404, 405; *Andrea, Inc. v. Radio*, 14 Fed. Sup. 226.)

Third: Since infringers of patents are permitted to pool their interests* and combine against the patentee and the inventor, and since others, such as workmen, farmers, etc. are permitted to pool their interests, there seems no reason why the same privilege should be denied those who in the language of the wise are the greater benefactors of all.** (Of course, lacking any price control or extra-patent

---

* For example, the cases defended by The National Automobile Chamber of Commerce (*Reo v. Gear Grinding*, 42 Fed. (2) 965 and the *Spot Weld Case*, 265 U. S. 445; *Swan v. Reeke-Nash*, 88 Fed. (2) 885).

** Francis Bacon gave the weight of his opinion to view somewhat similar to the above. He says:

"The introduction of great inventions appears one of the most distinguished of human actions, and the ancients so considered it; for they assigned divine honors to the authors of inventions, but only heroic honors to those who displayed civil merit; such as the founders of cities and empires, legislators, the deliverers of their country from last misfortunes, the quellers of tyrants, and the like. And if any one rightly compare them, he will find the judgment of antiquity to be correct; for the benefits derived from inventions may extend to mankind in general, but civil benefits to particular lands alone; the latter, moreover, last but for a time, the former forever. Civil reformation seldom is carried on without violence and confusion, while inventions are a blessing and a benefit without injuring or afflicting any.

* * * * *

"Now among all the benefits that could be conferred upon mankind, I discovered none so great as the discovery of new arts for the bettering of human life. For I saw that among the rude people of early times, inventors and discoverers were reckoned as gods. It was seen that the works of founders of States, law-givers, tyrant-destroyers, and heroes cover but narrow spaces, and endure but for a time while the work of the inventor, though of less pomp, is felt everywhere, and lasts forever."

On this subject Lincoln, on February 22, 1860, said:

"Next came the patent laws. These began in England in 1624, and in this country with the adoption of our Constitution. Before then any man (might) instantly use what another

(Continued on page 70)

monopoly.) As inventions have become more abstruse, the difficulties and the expenses of presenting patent causes, ripe for adjudication, have increased until, in many instances, such as the present, they have exceeded the purses and the abilities of individual inventors. Hence, as with the other classes we have named, inventors and, as must inevitably happen, other types of patentees, have united in protecting their patents. What petitioners call the "piston patent pool" was initiated and advanced by an individual inventor named Mooers (patentee of one of the patents in this suit) seven years before the Aluminum Company took a license thereunder. Other inventors are involved as individuals, and since patents had been granted to Aluminum Company of America, and to others, which patents were important, if not essential, to protect the interest of Mr. Mooers and these individual inventors, these patentees were admitted to the group also. If the Aluminum Company is the co-beneficiary with the individual inventor Mooers, it is because the government has granted piston patents to the Aluminum Company. The bread that Mr. Mooers has earned by the sweat of his brow should not be destroyed because the government has made him a bedfellow with one of whom the petitioners disapproved.* The eighty patents included in the group are a small part of the existing piston patents, are few compared with the number of patents owned by many big corporations, and include many

---

*It would seem that judgment, even of the petitioners, about the Aluminum Company might abide the trial of the cause of the United States against that company, now pending before Judge Caffey in the Southern District of New York.

(Continued from page 69)

man had invented, so that the inventor had no special advantage from his invention. The patent system changed this, secured to the inventor for a limited time exclusive use of his invention, and thereby added the fuel of interest to the fire of genius in the discovery and production of new and useful things."

patents which are unimportant, but through the purchase of which many individual inventors have recovered their investments.

Thus not only has invention been encouraged through the grouping of these patents by providing individual inventors with a possible means of realizing on their inventions through cooperative action, but also by the purchase of patents from individual inventors at prices which have assured them a profit on their investments which could not have been realized by them otherwise. The scheme is but another one of those changes evolved in a system to meet changed conditions. The scheme benefits the inventor; it benefits the public, it is the infringer alone who is inconvenienced, and it is the infringer alone who has complained. We note that it is a matter of common knowledge in this industry, as well as with the well informed general public, that the Department of Justice of the United States made a thorough and careful investigation of the plaintiff's "piston patent pool"; and took no action.

Petitioner's general attacks warrant, if they do not demand, a general answer. History has so well established the advantages to the public of the American patent system that those advantages cannot now be denied, as Lincoln said (see quotation *supra*). Few inventions were made prior to its institution and those few were widely scattered over time. The administrations of all patent systems prior to the year 1800 were ineffective; as administered they were a fraud on, rather than an aid to, inventors. The people of the United States were so indignant over the successful manner in which the cotton planters deprived Eli Whitney of his invention of the cotton gin and his rights to rewards therefor that there arose in the United States in the early part of the last century, a popular clamor for the better administration of the patent laws. It resulted that the Courts in this country soon thereafter developed and adopted a

system of providing real protection to inventors. There followed such a host of important inventions as to initiate a period of progress and prosperity such as the world had never before known in any country or at any time. This has continued until people have forgotten the hardships of the preceding eras. It is the loss of the inventor that people so soon forget the hardships he has eliminated.

There is just off the press a book entitled "March of the Iron Men" by Roger Burlingame, which summarizes these facts and proves the statements made by Bacon, Lincoln, and others, which we have quoted *supra*. We know now that inventions made during certain political eras of this country, as Mr. Burlingame points out in particular and Sir Francis Bacon pointed out in general, were more important than any political or social event that happened during those periods. The invention of reaping machinery during the time of Andrew Jackson, for example, was more important than any other event that happened during that period. The invention of Howe's sewing machine in 1846 was more important than any political happening during Polk's administration. Other comparisons are made by or are apparent from the data given by Mr. Burlingame. (See pp. 468-476 of his book.)

It is equally true that there were in political life both the liberals and progressives prior to this era, just as there are liberals and progressives in the non-machine countries today. Progress and liberalism, however, have depended upon the production by machines of the wealth to be distributed, and upon the production of those machines by inventors. No one had more liberal and more progressive intentions and designs than Lenin and his associates. Their efforts both at liberalism and progressiveness failed because there was no machine-produced wealth to distribute and no inventors to invent machines. They sought to save themselves from these failures by introducing the machines

invented in other countries, but their efforts came too late to save either their intended liberalism or progress.

If, therefore, it be necessary to a continuation of the encouragement of inventors that in a changing world, they be permitted to pool their patents, that course, even though it resulted in some minor disadvantages to the public, is justified if it preserves or encourages the greater advantages and benefits to the public of continuing the productions of inventions which have initiated and continued the great era of progress and prosperity to which we have referred. Nor is this great cause to be slowed or stalled because it is helped and advanced by one of whom the petitioners disapprove. Assuming that a practice of pooling patents involves minor evils along with major benefits, such is true of any new law or procedure. It is true of any reform. It is true of any progress. As Sir Francis Bacon said "civil reform seldom is carried on without violence and confusion." Whatever, if any, disturbance may have been caused by the pooling of patents, no violence or confusion has been caused thereby.

Patent pools are by no means new. The first recorded patent pool in this country was formed in the middle 1850's around the Howe sewing machine invention. No one can doubt the lasting benefit conferred upon women in all countries and in all times by the invention of the sewing machine. Yet Howe, the inventor, reaped nothing but disaster until he and his backer pooled his patent with those of others, including the Singer Sewing Machine Company, which was anathema in those days. There is no reason why Mr. Mooers should not have benefited by Howe's experiences and formed this "piston patent pool" without experiencing the hardships of Howe before its formation. Howe's patent pool was formed and conducted to best promote the sale and use of the sewing machine. Every patent pool since that time has been formed and conducted for sim-

ilar purpose. In the instant cause, successful adoption and use of aluminum pistons is bottomed upon careful manufacture and scientific machining of those pistons. Departure from either of these precepts spells disaster not only to the user of a poorly made or machined piston, but calamity to the reputation of the aluminum piston and a cessation of its further use. The public—even the automobile repairing public—is unable to tell the difference between a good aluminum piston and a bad aluminum piston, so much do the alloys, from which, and the designs on which, good and bad aluminum pistons are made resemble each other. It was and is, therefore, not only to the interests of the public who use aluminum pistons, but essential to the success of the aluminum piston, that its manufacture should be confined to those skilled in the making of aluminum piston alloys, the casting of the crude pistons, and the scientific machining of the same to the intended designs with the almost inconceivably small clearance essential to success. To have extended the rights to manufacture aluminum pistons under the patents in suit, indiscriminately, would have resulted in innumerable wrecked automobile engines and in a destruction of the reputation of the aluminum piston and an end to the use of these pistons and the realization of the benefits that accrued to the public from their use. It was for this reason that licenses under the patents were limited to the present licensees, who are enough to furnish adequate competition from a sufficient number of sources of supply.

The situation is not without analogy to practicing medicine and filling druggists' prescriptions. No doubt licenses issued, helter-skelter, to practice medicine and fill prescriptions would cheapen both medical services and medicines, but a lot of people would be poisoned. A poisoned engine is also a disaster. Therefore, aside from any legal rights which respondent may have to control its patent rights as it thinks wisest (see *U. S. v. General Electric*, 272 U. S.

476), public convenience and public policy justified limiting the licenses issued.

Counsel have referred frequently to the Aluminum Company of America as if it were taken for granted that the mere name of that company is justification for striking down the patent rights of the inventors and other patentees whose interests are intrusted to the plaintiff. There is no justification for assuming that patent rights should be destroyed or restricted because the Aluminum Company of America is a licensee under those patents. Nor is it material to any issue in this cause that the Aluminum Company of America failed on a group of patents different from those here involved, in a suit foreign to this suit, brought by the Aluminum Company of America against the manufacturer of the pistons held to infringe in the instant cause.

We have dealt with these matters at this length because we have felt that this underbrush ought not to confuse the real issues presented by the petition, and because so often the broader principles involved are forgotten in a more technical discussion of narrower issues.

Conclusion: The error of petitioners' position is reflected in the last sentence of its section Point IV (see petitioners' brief, p. 52):

> "The question was not whether invalidity was shown 'by clear and cogent evidence,' but whether, as a matter of law, a patent is valid which does not disclose, describe or discuss in its specification *an element* found to be essential."

This would be forcible if "an element" had been omitted from the original disclosure, but the element, i.e. the web, is not omitted; it was originally included in each the drawing, the specification, and in claims of each of the patents in suit. It is a description of an inherent property of the material of the web, i.e. flexibility, that was omitted.

This statement shows, as we have contended throughout this brief, that petitioners' claim that the disclosure omitted an element—which might be fatal to a patent claim under the law—is in effect a claim that there is omitted only the mention of a potency inherent in the material of the element and known to be so by everyone in the industry and which the law does not require be included.* (*Radio vs. Radio*, 293 U. S. 1, 14.) *Thus does the final sentence of petitioners' brief point the error of petitioners' contention.*

Much in generalities ought to be said in conclusion, but we will limit ourselves to the observation that in equity and good conscience the rights of those, whom such master thinkers as Sir Francis Bacon and Abraham Lincoln have proclaimed as the greatest of human benefactors, should not be stricken down on such hair-splitting technicalities as are here urged. No one in his senses doubts for a moment that the patents do, in fact, and have, in fact, furnished more evidence to the builders of pistons than is furnished such builders by the engineer who designed the piston built by those builders. No one in his senses questions the sufficiency of the disclosures to teach those skilled in the art how to build the pistons. The maker of the infringing pistons had no difficulty in duplicating the plaintiff's licensees' pistons after that maker failed to succeed with pistons of its own design. (R. p. 1074.)

Everyone knows that in this imperfect world imperfection of a dialectic nature can be found in every document, legal or otherwise classified, but nobody can cite any instance where any Court of Equity in this or any other land struck down a patent or any other contract because of

---

* The fatal effect would apply only to the claims which included the omitted element since the disclosure without a recitation of the element would support claims not reciting it (*Boyce v. Stewart-Warner*, 220 Fed. 118, 123, C. C. A. 2).

a failure to do the impossible, i.e. describe all the known properties inherent in all the elements.

We think the Court of Appeals should be affirmed.

If this Court should, nevertheless, reverse the Court of Appeals, we think the cause should be remanded to the Court of Appeals with directions to that Court to rule upon the claims of the Gulick and Maynard patents * and the other patents in question which are involved in the cause and in the appeal and presented to the Court of Appeals, but which the Court of Appeals did not rule upon because of the presumption by the Court of Appeals that its decision would stand as a final disposition of the cause and would be unchanged, and if it did stand as a final disposition of the cause and was unchanged, there would be no need—or so that Court thought—of ruling upon these other matters and questions. If this Court should reverse the Court of Appeals on the questions that the Court of Appeals did decide, then the decision of the Court of Appeals on the questions not ruled upon by that Court would become important. In other words, the Court considered that full recovery could be had by the plaintiff under the claims of the Gulick and Maynard patents selected by that Court from those relied upon and, without disposing of the other questions, ordered the cause dismissed without prejudice with respect to these other questions. If this Court should reverse the Court of Appeals on the claims of Gulick and Maynard thus selected and ruled upon so that no recovery can be had upon them, it is obvious that these other questions become important and should be considered and disposed of by the Court of Appeals in lieu of those which that Court selected and ruled upon as sufficient in the light of the Court's pre-

* Some of these claims did not recite the webs and, therefore, would not be involved even if petitioners were right on all four of their points.

sumption that its ruling would be final. (*Crown Cork & Seal Co. v. Ferdinand Gutmann*, 82 L. Ed. 835, Advance Opinions; *Cramp v. International*, 228 U. S. 645, 57 L. Ed. 757.)

PETITION FOR REHEARING

Of a Petition for Writs of Certiorari to the Circuit Court of Appeals for the Sixth Circuit.

To the Honorable The Chief Justice of the United States, and the Associate Justices of the Supreme Court of the United States:

Respondent brought suit against Petitioners, alleging infringement of five patents relating to pistons for internal combustion engines. The District Court held all the patents invalid and further held that the accused device (Ex-

hibit 1) employed "the essential structure, function and mode of operation of the prior art" (Rec. p. 1105), confirming the report of a Special Master before whom the case had been tried. The Court of Appeals for the Sixth Circuit held two* of the five patents to be valid, and to have been infringed by the Exhibit 1 piston, reversing the decree of the District Court as to those two patents, and ordering that the Bill be dismissed **without prejudice** as to the remaining three patents.

On February 14 last, this Court denied Petition for Writs of Certiorari.

There is no conflict of decisions, as between different Circuits, on the question of validity of these patents. However, due to the peculiar situation of the automotive industry, there is only the remotest possibility that any other Circuit Court of Appeals will ever be afforded an opportunity to pass upon the validity of these patents.

Since the denial of the Writs in these cases there has been published in the "Automotive Industry" of February 26, 1938, certain data with reference to the manufacture of automobiles which unmistakably shows that, through the decision of the Circuit Court of Appeals for the Sixth Circuit in these cases, Respondent has established the validity of its patents against 94.67% of the automotive industry. These circumstances, it is thought, should take the case outside the general rule requiring a conflict of decisions as a prerequisite to the grant of a Writ of Certiorari in patent cases, and we respectfully suggest that in view of the existence of such a situation this Court, in the interest of justice, should not refuse to review these cases at this time, unless it is satisfied of the soundness of the decision of the Circuit Court of Appeals

*Gulick 1,815,733.
Maynard 1,655,968.

on the question of validity of the Gulick and Maynard patents.

I.

In "Automotive Industry," a recognized trade paper, there was published, on February 26, 1938, data showing the sales of automobiles by the various manufacturers in the period 1929 to 1937. From the published data the following condensed summary may be made:

Manufacturers Within the Sixth Circuit.		Manufacturers Without the Sixth Circuit.	
General Motors	8,787,556	Auburn	94,783
Chrysler	4,170,813	Austin	12,045
Ford	6,399,757	De Vaux	6,166
Continental	4,263	Durant	77,519
Graham	192,077	Franklin	25,585
Hudson	810,155	Marmon	41,830
Hupmobile	119,563	Nash	399,535
Packard	317,563	Studebaker	482,941
Reo	54,018	Miscl.	58,542
Willys	439,026		
Total	21,294,814	Total	1,198,946

Of the manufacturers without the Sixth Circuit but two, Studebaker and Nash, remain in the business today. During the month of February, 1938, Studebaker and Nash together produced but 2.61 per cent* of the automobiles manufactured in this country. As a practical matter, through the expedient of suing their dealers or otherwise,

*"Automotive Daily News," Detroit, Michigan, March 3, 1938, Vol 13, No. 2489. This publication as well as the "Automotive Industry" of February 26, 1938, are called to the attention of the Court in accordance with precedent (Brinkerhoff-Faris Co. v. Hill, 280 U. S. 550, 281 U. S. 673; Olmstead v. United States, 276 U. S. 609, 277 U. S. 438; St. Louis Union Trust Co. v. Mellon, 231 U. S. 648, 241 U. S. 657, 242 U. S. 666; Helvering v. Northern Coal Co., 290 U. S. 59; Sanitary Co. v. Winters, 278 U. S. 587, 280 U. S. 30, 34; Paramount Publix Corp. v. American Triergon Corp., 294 U. S. 464).

even these two nonresident automobile manufacturers may, in effect, be subjected to the jurisdiction of the Sixth Circuit Court of Appeals, as indeed they have been in the past (Reeke-Nash Motors Co. v. Swan Carburetor Co., 88 Fed. [2d] 876; Gear Grinding Company v. Studebaker Company, 270 Fed. 93).

II.

Having such complete jurisdiction of the automobile manufacturers, the decision of the Sixth Circuit Court of Appeals will be the last word upon the validity of the Gulick and Maynard patents, unless this Court intercedes. The automobile manufacturers use and sell the pistons and hence are chargeable with infringement, notwithstanding that the piston may have been fabricated without the Sixth Circuit.

It is not reasonable to expect that Respondent will go outside of the Sixth Circuit to sue a piston manufacturer when it can cut off the piston manufacturer's outlet by bringing suit against the automobile manufacturers within the Sixth Circuit, where the patents have been sustained as valid. Respondent declined an invitation (Rec. p. 22) to bring suit against the manufacturer (an inhabitant of the Eighth Circuit) of the piston accused in these cases.

Respondent has maneuvered so as to be in a position such that if it won in the Sixth Circuit, it would have practically all the relief it was entitled to, and could rely upon this Court's rule, with reference to the necessity of conflict of decisions, to avoid a review of the validity of its patents by this Court, but, in the event that it lost in the Sixth Circuit, it could still sue elsewhere. Respondent thus had "two bites at a legal cherry," but the piston manufacturers and the automobile manufacturers have no such alternative to fall back upon. The piston manufac-

turers and the automobile industry have no such opportunity, in a subsequent suit, to establish a conflict of decisions.

Under the circumstances shown, we submit, the general rule of this Court, that a conflict of decisions is prerequisite to a review of patent cases, works a hardship upon the manufacturing industry, but offers an advantage to Respondent.

In our Petition for Writs of Certiorari we contended, correctly, we think, that the decision of the Sixth Circuit Court of Appeals was in discord with various decisions of this Court. It is deemed unnecessary to repeat here, except to pray the Court to re-examine the points brought out by the Petition, and that, unless the Court is satisfied of the soundness of the decision below, to grant the Writs.

Wherefore, it is prayed that the Petition for Writs of Certiorari in the above-entitled causes be re-examined and reconsidered with the view that, if the Court deems the decision of the Circuit Court of Appeals on the issues of validity to be unsound in any respect, the Writs be granted.

Respectfully submitted,

MOTION FOR LEAVE TO FILE SECOND PETITION FOR REHEARING

Upon Petition for Writs of Certiorari to the United States Circuit Court of Appeals for the Sixth Circuit.

To the Honorable, The Chief Justice of the United States, and the Associate Justices of the Supreme Court of the United States:

Now come Petitioners in the above-entitled cases and move for leave to file their Second Petition for Rehearing (lodged herewith) upon their Petition for Writs of Certiorari to the Circuit Court of Appeals for the Sixth Circuit.

In support of this motion Petitioners show:

That, in their Petition for Writs of Certiorari, Petitioners charged that it was "doubtful that Respondent will permit another Circuit Court of Appeals to adjudicate the patents here in suit (Petition, p. 13) because of the fact that all of the important* aluminum piston business in this country is controlled by the Sixth Circuit decision, and that Respondent would prefer to forego any attempt to enforce its patents against lesser infringers elsewhere, rather than to risk adjudication thereof in another circuit.

To this Respondent answered (Br. p. 5) that there were other infringers in other circuits, and that "there has been no time to institute suit against" others in other circuits "and no need to do so until it can be determined whether such infringements will cease without suit." Again in opposition to our Petition for Rehearing Respondent said (Br. p. 3) that "they may withhold litigation until others have had a reasonable opportunity to conform to the rulings of the Court of Appeals for the Sixth Circuit."

That Petitioners challenge the sincerity of Respondent, in impliedly thus saying to this Court, that if the other manufacturers in other circuits did not conform to the ruling of the Court of Appeals for the Sixth Circuit, suits would be instituted in other circuits. More than seven months have now elapsed since the decision of the Sixth Circuit Court of Appeals. Although the opportunity exists in the Seventh, Eighth and Ninth Circuits (as shown by the annexed affidavit of Gregory Barac), Respondent has not yet instituted suit in any other circuit.

That Respondent has had ample "time to institute suits"

*95% of the nation's aluminum piston business—see annexed affidavit of Horace Duncan.

in other circuits, if it had any intention of so doing, and the manufacturers in other circuits have had ample "opportunity to conform to the ruling of the Court of Appeals for the Sixth Circuit" if they purpose to do so.

That the Respondent has confined, and in all probability will continue to confine, its litigation to the Sixth Circuit rather than to risk its patents in another circuit and thus Respondent is in position to forestall a conflict between decisions of different circuits and consequently to forestall an adjudication of its patents by this Court unless this Court intercedes in these cases.

That no member of the public can compel Respondent to adjudicate its patents in any other circuit, and there is no indication that Respondent will ever voluntarily afford any other Circuit Court of Appeals an opportunity to adjudicate Respondent's patents.

That the Petition for Writ of Certiorari and the Second Petition for Rehearing thereon are meritorious and present questions of great public importance as well as important questions of patent law which have not been settled by this Court.

Wherefore, it is prayed that leave be granted Petitioners to file their Second Petition for Rehearing (lodged herewith) upon their Petition for Writs of Certiorari.

THE SCHRIBER-SCHROTH COMPANY,
THE ABERDEEN MOTOR SUPPLY COMPANY,
THE F. E. ROWE SALES COMPANY,
Petitioners.

JOHN H. BRUNINGA,
JOHN H. SUTHERLAND,
Attorneys for Petitioners.

It is hereby certified that the foregoing Motion for Leave to file Second Petition for Rehearing is believed to be well founded in law and in fact, and that it is not interposed for the purpose of delay.

John H. Bruninga.

AFFIDAVIT OF HORACE DUNCAN.

State of Missouri,
City of St. Louis. } ss.

Horace Duncan, being duly sworn, deposes and says that he is secretary and treasurer of Sterling Aluminum Products, Inc. (formerly called Sterling Products Corporation); that he has been engaged in, and familiar with, the aluminum piston business since 1923; and that he is, and has been, in position to estimate the volume of aluminum piston business done by the competitors of Sterling Aluminum Products, Inc.

That, in the opinion of affiant, more than ninety-five per cent of the aluminum pistons manufactured in the United States are either manufactured by manufacturers located within the States of Ohio and Michigan, or manufactured by Sterling Aluminum Products, Inc., or assembled into automobiles by manufacturers located within the States of Ohio and Michigan.

Horace Duncan.

Sworn to and subscribed before me this 21st day of May, 1938.

My commission expires November 4, 1940.

Joseph V. McShane,
Notary Public.

(Seal)

AFFIDAVIT OF GREGORY BARAC.

State of Missouri, }
City of St. Louis. } ss.

Gregory Barac, being duly sworn, deposes and says that he is of lawful age, that he is assistant to the Manager of Replacement Sales of Sterling Aluminum Products, Inc., of St. Louis, Missouri, and that he is familiar with the type of aluminum pistons offered for sale to the replacement trade by the competitors of Sterling Aluminum Products, Inc.

Affiant further says that pistons of the character shown in the following cuts

have been, and are being offered for sale in the replacement trade by the competitors of Sterling Aluminum Products, Inc. That the piston shown in Figure 1, above, is being offered for sale and sold by the Elgin Machine

Works, Inc., of Elgin, Illinois, and that on May 17, 1938, affiant purchased the piston shown in Figure 1 from said Elgin Machine Works, Inc.

Affiant further says that on May 17, 1938, he purchased the piston shown in Figure 2, above, from Automotive Warehousing Company of St. Louis, Missouri, and was then and there informed that said piston was manufactured by the United Engine and Machine Company of San Leandro, California.

Gregory Barac.

Sworn to and subscribed before me this 21st day of May, 1938.

My commission expires November 4, 1940.

Joseph V. McShane,
Notary Public.

SECOND PETITION FOR REHEARING

Upon Petition for Writs of Certiorari to the Circuit Court of Appeals for the Sixth Circuit.

To the Honorable, The Chief Justice of the United States, and the Associate Justices of the Supreme Court of the United States:

Petitioners recognise that, as a general rule, this Court should not be burdened with patent cases, save where

there is a conflict between decisions of different circuits. But in a case such as this where the decision of one Circuit controls virtually the entire industry throughout the United States, at least the ninety-five per cent* of it, the Court would be justified in relaxing the general rule as it did in Paramount Publix Corp. v. American Tri-Ergon Corp., 294 U. S. 464, and in Altoona Publix Theaters, Inc., v. American Tri-Ergon Corp., 294 U. S. 477, where a comparable situation as to nation-wide effect of the decision of one circuit prevailed.

Indeed, in the instant cases there would appear to be stronger reason for relaxing the rule than in the case of Altoona Publix Theaters, Inc., v. American Tri-Ergon, Corp., supra, where the lower courts had concurred in holding the patent valid. On the contrary, in the instant cases the Circuit Court of Appeals is the only one of three tribunals considering this litigation that has held the patents valid. The cases were tried on the merits before a Special Master who found the patents invalid (R. pp. 1106-9). Upon exceptions the District Court confirmed the Master's report holding the patents invalid (R. p. 1229). Then the Circuit Court of Appeals reversed, and held valid two of the five patents sued upon, dismissing without prejudice as to the other three patents (R. p. 2395).

As thus narrowed by the Court of Appeals the sole issue now involved in these cases is whether Respondent has a

*Affidavit of Horace Duncan annexed to Motion for Leave.

right to prevent Petitioners from making and selling an aluminum piston as shown:

Exhibit 1

where that piston is nothing in the world but the piston of the **Respondent's own** now-expired Schmiedeknecht patent (R. p. 1305)

Perspective view of Schmiedeknecht patent piston

slotted to embody the teaching of **Respondent's own** now-expired Franquist patent (R. p. 1687):

> "With this object in view, the invention consists of a piston having a sleeve which is circumferentially compressible and is adapted to have a snug sliding fit in the cylinder when cold, so that upon an expansion of the piston its sleeve will automatically yield sufficiently to prevent the piston from sticking in the cyl-

inder, and after the cylinder has also expanded will again automatically resume substantially its normal size and take up the free play between the cylinder and piston, which would otherwise occur" (p. 1 of patent, lines 14-25).

The Court of Appeals held that Petitioners' Piston, Exhibit 1, supra, infringed the Gulick and Maynard patents. The Special Master and the District Court had held (Fact Finding 51, R. p. 1105) that Petitioners' accused pistons were of the prior art.

Through the expedient of pooling many patents Respondent was enabled from 1924 to control the marketing of the type of piston exemplified by Exhibit 1 under and by virtue of the Franquist and Schmiedeknecht patents until their expiration. Notices were issued, suits brought, judgments recovered, injunctions issued upon the Franquist patent. Upon the eve of its expiration, Respondent had issued to it the Gulick patent, application for which had been filed fourteen years before. After the issuance of the Gulick patent, and in order to devitalize the anticipatory effect of Franquist, Respondent repudiated its time-worn contention that the Franquist patent was pioneer and denounced the Franquist patent as being the very opposite of that which was required for aluminum piston construction (Master's Report, Rec. pp. 1121, 1122-3).

In the Petition for Writ of Certiorari Petitioners presented several novel and important propositions of law. Petitioners charged that the Court of Appeals for the Sixth Circuit had failed to apply or had misapplied the decisions of this Court, and that if the decisions of this Court had been properly applied, both the Gulick patent and the Maynard patent would have been held invalid.

One of these propositions, in the belief of Petitioners, will

dispose of the whole case, as narrowed by the Court of Appeals decision. This has reference to the sufficiency of the specifications of the Gulick and Maynard patents to comply with the requirements of the Statute, R. S. 4888.

If According to Permutit v. Graver, 284 U. S. 52, a Patentee Cannot Predicate a Patent Monopoly Upon Something Which is Not Described in His Patent Specification, Can a Patentee Predicate a Patent Monopoly Upon the Very Opposite of That Which Was Described in His Specification as Filed in the Patent Office; Especially Where, After Intervening Rights Arose, the Specification Was Amended to Describe the Very Antithesis of That Which Was Originally Described.

The importance of this proposition, as an abstract question of law, is significantly illustrated by the fact that, at this term of this Court, it has been presented by the Petitions for Writs of Certiorari in two other cases, to wit: United States of America v. Robert Esnault-Pelterie, No. 231, and Wabash Appliance Company et al. v. General Electric Company, No. 712. The Court's decision in No. 231 was predicated upon a different point, and the Court denied the petition in No. 712 so that the Court has not yet expressed its views with reference to the proposition presented here.

In this case it is indisputable that the Gulick patent application, as filed in the Patent Office, described the so-called "webs" as "extremely rigid" (R. p. 1839). It is indisputable that four years and ten months later the Gulick specification was changed (R. p. 1867) to describe the webs "laterally flexible." It is indisputable that in the meantime others had adopted, used, and commercialized aluminum pistons with flexible webs (R. pp. 1102-3). It is in-

disputable that in its decision (R. pp. 2386, 2392) the Court of Appeals for the Sixth Circuit regarded "flexible webs" as the very essence of the piston which that Court found the patents to cover. The Court of Appeals held that Respondent was within its rights in so amending the Gulick specification. Unless this Court approves such a ruling it is thought that it should intercede and review the cases.

The Maynard patent contains no description at all of "flexible webs," and, consequently, as to that patent, this case is indistinguishable from this Court's decision in Permutit v. Graver, 284 U. S. 52. Were it not for the disposition of the Sixth Circuit Court of Appeals to restrict, or to refuse to apply the doctrine of Permutit v. Graver to the same extent which other courts have applied it (vide, cases cited in Petition, p. 9), it would seem inescapable that, if "flexible webs" was an element of the combination patented by Maynard, the patent was invalid under Permutit v. Graver.

The Gulick patent, as issued, does describe flexible webs. As filed, the application for it described the very antithesis of flexible webs. After intervening rights arose the change was made. As to Gulick, therefore, the Court of Appeals' decision involves not only a refusal to apply the doctrine of Permutit v. Graver, but, compounded with that, a disregard of the doctrine of Powers-Kennedy Corporation v. Concrete M. & C. Co., 282 U. S. 175.

Although these points were stressed in the presentation of the case to the Court of Appeals, its decision is strangely silent with reference to the effect of the Permutit v. Graver and Powers-Kennedy Cases. Obviously, if anything had been said by the Court of Appeals with reference to those cases, it would have been unqualifiedly wrong, if consistent with the ultimate decision as to the validity of the patents.

It goes without saying, we think, that if this Court's decision in Permutit v. Graver had come down before the Gulick patent was issued, or before the decisions of the administrative tribunals with reference to Gulick's right to make such antithetical amendments in his specification, the Gulick patent, in its present form at least, would never have been issued.

That this Court has not varied from the doctrine of Permutit v. Graver is emphasized by the fact that as recently as May 16, 1938, this Court applied the doctrine of that case to hold invalid the patent involved in General Electric Company v. Wabash Appliance Company et al., No. 453.

Public Importance.

Contrary to the usual situation in patent cases which this Court may be urged to review, the decision of the Sixth Circuit Court of Appeals in these cases is the practical equivalent of a decision of this Court in so far as its effect upon the aluminum piston industry is concerned. Not only are the automobile manufacturers, the principal users of aluminum pistons, located within the Sixth Circuit, but large numbers of aluminum pistons have been manufactured within the Sixth Circuit, and, furthermore, as pointed out by the Court of Appeals in its decision, the proceedings in these cases have been carried on by Sterling Products Corporation (now called Sterling Aluminum Products, Inc.) of St. Louis, Missouri. Others make less than five per cent of the aluminum pistons made in this country.

As shown in the Motion for leave to file this Petition for Rehearing, the opportunity for Respondent to institute suits prevails in the Seventh, Eighth and Ninth Circuits, but from the standpoint of business prudence, it is unrea-

sonable to expect that Respondent will risk its ninety-five per cent control of the aluminum piston industry in any effort to dispose of the other five per cent. It is unreasonable to think that Respondent has any intention of giving another Circuit Court of Appeals an opportunity to adjudicate the Gulick and Maynard patents. Respondent itself being an inhabitant of the Sixth Circuit, no member of the public can force an adjudication of the patents in another circuit by declaratory judgment proceedings, or otherwise.

In such a situation it is evident that this Court will never have an opportunity to resolve a conflict between decisions of different Circuit Courts of Appeals. In such a situation the general rule of this Court not to take patent cases, save to resolve such a conflict, is unduly harsh upon the manufacturing industry and unjustly favorable to a patentee. Such a rule leaves it within the control of the patentee to say whether this Court shall pass upon his patents.

Wherefore, it is prayed that the Court reconsider the Petition for Writs of Certiorari in these cases and grant the same.

Respectfully submitted,

JOHN H. BRUNINGA,
JOHN H. SUTHERLAND,
Attorneys for Petitioners.

May 21, 1938.

I hereby certify that the foregoing Petition for Rehearing is filed in good faith and not for the purpose of delay.

John H. Bruninga.

RESPONDENTS' BRIEF OPPOSING PETITION FOR REHEARING.

No point is now presented which was not fully discussed and presented to this Court in the briefs and the Petition for Writ of Certiorari.

No point or fact within the record is mentioned or referred to as having been overlooked by the Court in its denial of the Petition for Writ of Certiorari.

No new fact or circumstance has arisen or is presented in the Petition for Rehearing.

Petitioners now advance only some statistics, newly published in certain newspapers or trade papers, purporting to color some old facts existing prior to and during the pendency of this case. The authorities cited by petitioners do not support an excursion into current newspaper statistics.

The point which petitioners seek to supplement from the current magazines or newspapers is exactly the same point advanced by petitioners at pages 13 and 14 of its Petition, to which respondents replied at pages 5 and 6 of its brief in opposition thereto; the difference being that in the first instance the parties based their arguments on the record, whereas in the present instance petitioners advance the same argument colored with statistics from the current newspapers.

Moreover, the inferences which petitioners now draw from the newspaper statistics are flatly refuted by the evidence in the record. There is no such proportion, as asserted by petitioners, of pistons embodying the inventions of the patents in suit used within and without the Sixth Circuit. Few of the automobile manufacturers make their own pistons. Only a portion of the pistons used in the automobile industry embody the inventions of the patents in suit,* and these pistons, with few exceptions, are licensed pistons. (R. p. 180.) Pistons are made by many manufacturers located outside of the Sixth Circuit. (R. pp. 2, 132, 134, 179.) A great proportion of the pistons sold are not for original automobile equipment but are for replacement by dealers and garage men located in every Circuit of the

---

* General Motors, for example, did not use the patented pistons in their regular production of pleasure cars. (R. pp. 179, 262 and 263.) Reo Motor Company and others did not use the patented pistons. (R. pp. 70 and 211.)

United States. (R. p. 143.) The great majority of these replacement pistons are purchased directly from the piston manufacturers and not from the automobile manufacturers. Many other manufacturers, including Diesel and gasoline engine builders, airplane manufacturers, tractor manufacturers, motor cycle engine manufacturers, motor boat and marine engine builders, and other manufacturers using patented as well as unpatented pistons are located in many parts of the United States outside of the Sixth Circuit. (R. p. 211.) It is unimportant that a large proportion of the automobile manufacturers are now located in the Sixth Circuit.

Petitioner cites *Reeke-Nash vs. Swan*, and *Gear Grinding vs. Studebaker*, as examples of litigation confined to one circuit, but in these instances the controlling point was that the entire automobile industry, combining through the Automobile Chamber of Commerce, elected to control the defense in order to gain an omnibus estoppel by judgment in all circuits against the patentee if he were defeated, *Reo vs. Gear Grinding*, 42 F. (2d) 965. In the case at bar the real party in interest, Sterling Products Corporation, a resident of the Eighth Circuit (R. p. 2384), first avoided a commitment of privity with petitioners, and only announced its privity with petitioners when it felt certain of a decision in their favor. At that time Sterling waived its right to stand suit on the merits in the Eighth Circuit, in expectation of enjoying an estoppel in its favor by the Sixth Circuit judgment. Now that the effect of the estoppel is against Sterling, it laments its choice.

Respondents assume that they properly should await termination of a test case in one Circuit before proceeding with duplicate litigation in other Circuits, and that likewise they may withhold litigation until others have had a reasonable opportunity to conform to the rulings of the Court of Appeals of the Sixth Circuit.

As pointed out in our main brief (pages 6 to 19), the only "specification of error" that is urged as controlling in the instant cause is the question of sufficiency of disclosure of the patents in suit. The Court of Appeals of the District of Columbia* and the Court of Customs and Patent Appeals,** both outside of the Sixth Circuit, each found in harmony with the opinion of the Court of Appeals of the Sixth Circuit on this question. What petitioners seek to gain by this Petition, as well as the Petition for Writ of Certiorari, is a review of the question of sufficiency of disclosure as to which three Courts of Appeal already have found in accord with respondents' contention.

CONCLUSION.

We cannot assume with Petitioners that this Court overlooked the instant point when it was presented on the Petition for Writ of Certiorari. Current newspaper statistics can have no additional weight on this point which has been considered and disposed of within the confines of the record of this case.

It is respectfully submitted that the present Petition should be denied.

Respectfully submitted,

A. C. Denison,
F. O. Richey,
Wm. C. McCoy,
Counsel and Solicitors for Respondents.

RESPONDENTS' BRIEF ON THE SECOND PETITION FOR REHEARING

Upon Petition for Writs of Certiorari to the United States Circuit Court of Appeals for the Sixth Circuit.

Petitioner presents nothing which has not already been presented to this Court for consideration twice be-

fore (once on the Petition for Certiorari and again on a Petition for Rehearing) except some of the statements contained in the affidavits appearing at pages 5 to 7. Even if evidence could be injected into a cause at this stage for the purpose of a petition for rehearing, as is undertaken to be done in this *ex parte* manner, the evidence attempted to be included in these affidavits is immaterial to any issue involved here, because the affidavits carefully, and apparently designedly, omit to say the only things that could make them material, as follows:

(1) The affidavit of Barac is carefully worded so as to avoid saying that the pistons illustrated in Figs. 1 and 2 are infringing pistons.

(2) In the affidavit of Duncan it is not said that the five per cent of pistons manufactured outside of the Sixth Circuit, or the ninety-five per cent made within the Sixth Circuit, are infringing pistons.

There is no allegation in either of the affidavits that the respondents now know, or ever did know, that the pistons shown in Figs. 1 and 2 were being offered for sale or sold by the Elgin Machine Works, Inc., at Elgin, Illinois, or by the Automotive Warehouse Company of St. Louis, Missouri, or the United Engine & Machine Company of San Leandro, California.

One other point that perhaps ought to be commented upon is the claim that the Court of Appeals was "strangely silent" with reference to the effect of the *Permutit v. Graver* and *Powers-Kennedy* cases. The Court of Appeals in its opinion stated that it could not deal with all of the questions involved in this extensive litigation and that it would limit its discussion to the

"more salient features" (92 Fed. (2) 333). The obvious fact follows, i.e., that the Court considered that there was no merit in the petitioners' contentions regarding the pertinency of these decisions on the facts involved in this litigation. (And see our full discussion of these two decisions in our Brief in Opposition to original Petition pp. 6 to 19.)

For our reply to the other matters presented in the Petition we direct this Court's attention to our briefs filed in opposition to the Petition for Certiorari and the rehearing thereon. For example, with respect to the blackfaced matter on page 13 of the Second Petition for a Rehearing, we call attention to the complete discussion and refutation on pages 6 to 19 of our "Brief for Respondents on the Petition for Certiorari."

The fact asserted on page 11, regarding illustrations there, is not supported by, but is contrary to, the record (R. pp. 177, 178, 203, 204, 246, 247, 254, 458, 460, 496, 528, 529, 536, 537, 552, 553, 554, 560, 567, 934-944, 1040; 1052, 1053, 1078. See also the opinion of the Court of Appeals 92 F. 2d 333 and 334.) Moreover, the earliest date of Schmeideknecht is subsequent to the established and accepted date of invention of the Gulick patent in suit.

Respectfully submitted,

A. C. DENISON,
F. O. RICHEY,
WM. C. MCCOY,
Counsel for Respondents.

PETITIONER'S ANSWER TO RESPONDENT'S MOTION TO AMEND THIS COURT'S OPINION OR IN THE ALTERNATIVE FOR A REHEARING.

I. *As To Amending The Court's Opinion:*

The amendments sought are (1) an expansion of the remanding clause so as to give explicit directions to the court below in three particulars rather than the general directions

which are usually given to proceed in conformity with the opinion of this Court, and (2) to correct some alleged errors in the opinion.

(1) We see no reason for these explicit directions other than to lay a foundation for respondent to argue before the court below that this court *intended* that it should reconsider the patentability of a combination which does not include webs laterally flexible, and which combination that court clearly indicated was not patentable *in view of the prior art*. The request by respondents is plainly an effort to avoid the effect of this Court's discussion of the prior art on page 4 of the opinion.

In addition to the prior art referred to in the opinion of this Court, it will be remembered that all of the claims of the Gulick patent were rejected on January 30, 1922, by the Patent Office, in view of some of the prior art referred to by this Court. Thereupon, the specification was altered to incorporate the feature of webs laterally flexible[1] and it was on that basis that the patent was eventually allowed.

It is contended that the court below could not have considered that webs laterally flexible was an element of such of the claims of the Gulick patent as did not contain it *specifically* and of the claims of the Maynard patent because of the statement in *McCarthy* v. *Lehigh*, 160 U. S. 110. Whether the court below was conscious of that rule or not is of no moment. It did specifically refer to webs laterally flexible as one of the elements of the invention and it indicated clearly that without such an element there was no patentable invention. Therefore, the only reasonable assumption that this Court could make, either as to claim 1 of the Gulick patent or any claim of either patent which does not specifically mention webs laterally flexible, was that the court below had read (in the sense of interpreting or limiting the broad language used in the claims to describe the webs) that element into the claims in order to

[1] R. Vol. IV, pp. 1865-66.

save them. It is well settled that a specification may be referred to in order to interpret a claim or limit it in order to save it[2] and that the phrase "substantially as described" is always implied in claims even though not expressed.[3]

In *Mantle Lamp Co.* v. *Bowman Co.*, 53 F. (2d) 441, the Circuit Court of Appeals for the Sixth Circuit, consisting of Judges Denison, Moorman and Simons, referring to the patent then before the court, said (p. 444):

> "We think also that the always implied 'substantially as described', and the doctrine of interpretation by the specifications, justify regarding the 'bond' of the claim as one which does effectively insulate the outer and inner members. The patent specifies, in line 61 of page 1, that the bonding substance shall be of low heat conductivity, and the succeeding lines emphasize that it is to be incapable of transferring much heat or cold from one to the other. Its 'non-heat transmitting properties' are again emphasized in line 115 of page 2. *To import this limitation into the claim is not to bring in an additional element. It is only to interpret with the aid of the specification one of the words of the claim, so that it may not be thought so broad as to be destructive.*"[4]

In the case at bar, all of the claims of the Gulick and Maynard patents in suit, which do not specifically mention webs laterally flexible, refer to the connection between the bosses and the skirt in varying language.[5] This is, of

---

[2] See Walker on Patents (Deller's Edition), Vol. II, §261, p. 1242, and cases there cited.

[3] See Walker on Patents (Deller's Edition), Vol. II, §272, p. 1264, and cases there cited.

[4] When emphasis is used in quotations it will be understood that the emphasis is supplied unless otherwise indicated.

[5] *Gulick Patent:*

Claim 1: The words are "*connected* to the head and to the upper and lower parts of the skirt"; *Claims 11 and 12:* "connecting *flanges* in the zone of the bosses, and extending from the

course, the web. To construe this connection or web as flexible is, to use the language in the case last cited—"not to bring in an additional element. It is only to interpret with the aid of the specification one of the words of the claim. * * *"

In *McCarthy* v. *Lehigh, supra*, the rule above stated is fully recognized. See the part beginning on page 116 and preceding the statement of the rule which is incorporated in the headnote quoted on page 4 of respondents' motion. This Court, in *American Fruit Growers, Inc.*, v. *Brogdex, Inc.*, 283 U. S. 1, 6, said:

> "The claim of a patent *must* always be explained by and read in connection with the specification."

The argument that the court below could not have predicated patentability upon the novelty of any *one* element of the combination simply raises a "straw man." This Court specifically held (opinion p. 5) that "the court below found invention in the Gulick disclosure in a combination of elements, of which one was 'webs laterally flexible' * * *." It is, of course, a well settled rule as stated in the motion (p. 8) that patentable invention may be found in a combination of old elements alone[*] or in a combination of old ele-

---

bosses to the skirt * * *"; claim 13: "separated pin bosses having integral *flanges* connecting them with the skirt"; claim 15: "*walls* integrally uniting said bosses, the guide portion * * *"; claim 16: "a pair of spaced *walls*, each of which connects one of said bosses to said cylinder-engaging parts * * *"; claim 30: "*tying means* extending from each of said wrist pin bearings * * *"; claim 33: "*means* integrally connecting each boss to both of said opposite main bearing portions."

Maynard Patent:

Claim 1: "*webs* on diametrically opposite sides of the piston * * *"; claim 6: "a plurality of *webs* integral with said head * * *"; claim 8: "a pair of substantially rectangular shaped webs * * *"

[*] *Loom Co.* v. *Higgins*, 105 U. S. 580 and many other cases.

ments and one or more new elements.'[1] Before the amendment which brought in the lateral flexibility of the webs, the Patent Office held that the old combination did not constitute invention. That the court below reached the same conclusion seems to be clear from its opinion. The combination which included the new element was what the court of appeals held to constitute the invention.

It is urged further that this Court should direct the lower court to apply the same rule to test the sufficiency of prior art disclosures which this Court has applied to the Maynard patent. Why any such direction should be given we are unable to see. The rules of construction of prior art items and the extent and sufficiency of disclosures therein are, of course, well settled. Some of the authorities are collected in Respondents' Motion, pp. 11-13. Any such direction as is asked for might readily be confusing. Every patent or other written disclosure must be construed according to the language used, with due regard to the rule that they are addressed to persons skilled in the art.

Moreover, there is nothing to show that the court below interpreted the disclosures of the prior art differently than this Court intepreted the Gulick disclosures as originally filed and the Maynard disclosures as issued. As we understand the opinion this Court applied neither a "liberal" nor a "strict" rule. It simply held that when Gulick said in his original specification that the webs provided "an extremely rigid connection between the piston pin bosses and the skirt" and made other statements to the same effect, it was not permissible for him to thereafter change the specifications so as to describe such webs as flexible, especially in the light of the testimony of respondents' own expert to the effect that inherent flexibility cannot be depended upon in the absence of correct proportioning of the different parts. So far as Maynard is concerned, it is not

---

[1] *Leeds & Catlin* v. *Victor*, 213 U. S. 301, 330; *Lyman Mfg. Co.* v. *Bassick Mfg. Co.*, 18 F. (2d) 29, 33 (C. C. A. 6th—Judge Denison).

disputed that there is not a word in the specifications about the webs being laterally flexible. These considerations make a discussion of the prior art referred to by respondent unnecessary and, indeed, out of place.

Quite apart from what has been said, respondent cannot complain of the remanding part of this Court's opinion because this Court would have been fully justified in directing that the court below treat the Gulick patent as invalid because of the amendment made to the specification. We now urge the Court to do so.[8] The specification of the Gulick patent as now issued contains an amendment which this Court has held it was not permissible to make because there was no basis for it in the specification as originally filed. Rule 70 of the Patent Office is as follows (p. 998):

> "In original applications all amendments of the drawings or specifications, and all additions thereto, must conform to at least one of them as it was at the time of the filing of the application. Matter not found in either, involving a departure from the original invention, can not be added to the application even though supported by a supplemental oath, and can be shown or claimed only in a separate application."

Consequently, if the decision of this Court had been before the Patent Office, the patent could not have issued with the amendment. As previously stated, the amendment was deemed essential for the allowance of the patent. It must logically follow, therefore, that the amendment has invalidated the patent *in toto*. This is, as we construe it, what was held by this Court in *Powers-Kennedy* v. *Concrete Co.*, 282 U. S. 175, 185. In the case of *American Bell Tel. Co.* v. *National Tel. Mfg. Co.*, 109 Fed. 976, 1005 (C. C. Mass.), the reason why an improper change in the specification should invalidate the whole patent is thus stated:

> "I am of the opinion that this patent is invalid for the reasons that the power to amend an application

[8] This Court is also justified in holding the Maynard patent invalid because, without the flexible web element, it did not exhibit any invention over the prior art.

does not include the power to change the nature of the invention; that the right to amend or the right to complete an application under section 4894, Rev. St. U. S., does not give the right to transform completely; that the only remedy for a radical mistake in substance so serious as to require a transformation so complete as is here shown is a new application."

The amendment to the Gulick Application was not only to the claims but to the description by changing "extremely rigid" to "laterally flexible." This not only changed the description of the structure but also the principle of operation. The specification does not comply with R. S. 4888, 35 USC 33, because it does not contain "a written description" of the Gulick piston as filed and does not "explain the principle thereof and the best mode in which he has contemplated applying that principle." The patent is, therefore, just as void as if it had never contained a written description or had never explained the principle.

Morecver, the rule is abundantly settled that claims predicated upon unlawful amendments to the specifications are invalid. *Insulite Co.* v. *Reserve Supply Co.*, 60 F. (2d) 433 (C. C. A. 8); *Boyce* v. *Stewart-Warner Speedometer Corporation*, 220 F. 123 (C. C. A. 2nd); *Standard Oil Development Co.* v. *James B. Berry Sons Co., Inc.*, 92 F. (2d) 386 (C. C. A. 3rd); *Kwik-Set* v. *Welch Grape Juice Co.*, 14 Fed. Supp. 137; Rev'd on other grounds, 86 Fed. 945); *The Chicago and Northwestern Railway Company* v. *Thomas Sayles*, 97 U. S. 554; *Eagle Mfg. Co.* v. *West, Bradley & Cary Mfg. Co., et al.*, 111 U. S. 490; *Western Electric Co.* v. *Wallerstein*, 51 F. (2d) 529; *Pomeroy* v. *Walker*, 64 F. (2d) 544; *Bonnot Co.* v. *Lopulco Systems*, 15 F. (2d) 848.

As the Patent Office refused allowance of any claims before the amendment, and since any claim which does not expressly or impliedly contain the subject matter of the amendment, was plainly foreshadowed by the prior art, it necessarily follows that the whole patent must be invalid, because a patent without valid claims is a legal impossibil-

ity. Whether the defect in the patent may be cured by disclaimer or reissue we need not now consider.

(2) *Suggested Corrections.*

We will discuss the suggested amendments of the opinion with reference to the letters used in respondents' motion (pp. 18-20).

(a) The statement in this Court's opinion as to claims 18 and 33, we think is entirely accurate. One of the elements "whereby said skirt is yieldable" (claim 18) is "a pair of spaced walls" (p. 3, line 117). These walls are the laterally flexible webs. Webs are treated as synonymous with walls in this Court's opinion on page 3.* They are also thus referred to in the patent, page 1, line 63.

The portion of claim 33 quoted in the motion recites only part of the elements that render the skirt wall yieldable. One of the other elements is "means integrally connecting each boss to both main bearing portions". This latter is, of course, the lateral webs.

(b) The alleged mistake referred to under (b) is immaterial. The fact is that the pooling agreement involves only one individual inventor, an automobile manufacturer and several manufacturers of aluminum pistons.

(c) The part of the opinion referred to under (c) is entirely correct. We refer to this under the next point.

II. *As To The Rehearing:*

We will answer the petition with reference to the subject matter under "A" and "B" of the petition, respectively.

A.

(a) We have already answered the grounds advanced in paragraphs 1, 2 and 4.

*"The piston head and skirt are connected by two 'webs' or walls extending longitudinally through the interior of the skirt".

(b) There is nothing in the evidence to show that the drawings of either the Gulick or Maynard patents are to scale, and this Court so found (Opinion, p. 6). As a general rule, patent drawings are not to scale. At any rate, this whole matter has been fully discussed in respondents' brief and our reply brief (See the latter, pp. 8-10; Resps.' Br. pp. 34-35).

B.

(a) This Court is now asked to change its conclusion that there was not a sufficient basis in the Gulick application as filed to justify the amendment that was made. The contention is that certain articles appearing in publications referred to in the record are no more explicit "to teach those skilled in the art how to make the pistons illustrated and described in these articles and how to operate them to make their principles available to the public" than the specifications of the patent in suit. Initially, it should be noted that none of these articles are relied upon by either this Court or the court below as part of the prior art. It is, therefore, quite impossible to see the relevancy of the present contention. But quite apart from that, the amendment was unlawful because its language was the very antithesis of that used in the specification as originally filed. This was considered and fully discussed by this Court (p. 8 of Opinion).

It is respectfully submitted that the motion should be denied.

Respectfully submitted,

THOMAS G. HAIGHT,
JOHN H. BRUNINGA,
JOHN H. SUTHERLAND,

In the Supreme Court of the United States

OCTOBER TERM, 1938.

THE SCHRIBER-SCHROTH COMPANY, *Petitioner,* vs. THE CLEVELAND TRUST COMPANY, CHRYSLER CORPORATION, *Respondents.*	No. 3.
THE ABERDEEN MOTOR SUPPLY COMPANY, *Petitioner,* vs. THE CLEVELAND TRUST COMPANY, CHRYSLER CORPORATION, *Respondents.*	No. 4.
THE F. E. ROWE SALES COMPANY, *Petitioner,* vs. THE CLEVELAND TRUST COMPANY, CHRYSLER CORPORATION, *Respondents.*	No. 5.

ON WRITS OF CERTIORARI TO THE UNITED STATES CIRCUIT COURT OF APPEALS FOR THE SIXTH CIRCUIT.

RESPONDENTS' MOTION, (1) TO EXPAND THE ITEMS REMANDED TO THE COURT OF APPEALS AND TO AMEND THE ORDERING CLAUSE OF THIS COURT ACCORDINGLY AND (2) TO MAKE CERTAIN CORRECTIONS IN THIS COURT'S OPINION OR IN THE ALTERNATIVE, A PETITION FOR REHEARING.

Now Comes the respondent in the above entitled cause and moves this Court (1) to amend the ordering clause occurring at the end of this Court's opinion, dated

November 7, 1938, handed down in these causes; and (2) to consider what seem to respondent to be errors in the opinion, either as they affect further proceedings below, or in the alternative, as they justify rehearing thereon.

The ordering clause of this Court's opinion in these causes, dated November 7, 1938, is as follows:

> "As the Court of Appeals did not pass upon other questions in the case, the causes will be reversed and remanded to it for further proceedings, in conformity with this opinion, with respect to such claims of the patents in suit as appellant below submitted to that court for adjudication."

I. We pray the Court to supplement this ordering clause by adding to the matters remanded to the Court of Appeals, partly to clarify, expedite and simplify the further proceedings there, the following:

(A) "but if the Court of Appeals did not read 'web flexibility,' 'laterally flexible' webs, or any other elements into any of the claims of either the Gulick or the Maynard patents ruled upon, as this Court, has assumed that the Court of Appeals did, then the Court of Appeals shall, after so declaring, review such claims on the assumption that such elements are not in such claims; and if the Court of Appeals did read such element or elements into any such claim or claims, then the Court of Appeals is directed to reconsider the question of patentability of such claim or claims without reading such element or elements into such claim or claims."

and

(B) that the Court of Appeals, in the further consideration of the causes by that Court, apply to the prior art the same rules on sufficiency of dis-

closure that this Court has applied to the Maynard patent in its opinion of November 7, 1938, and that the Court of Appeals thus review the prior art without restriction by what this Court has said about any item of the prior art.

II. We pray that this Court further consider those points in the opinion which we point out in Part II of this Motion, as seeming to us erroneous, and thereupon either modify appropriately the instructions for further hearing below, or in the alternative, grant a rehearing thereon.

FOREWORD.

Upon the questions which respondent understood to be presented by the petition for certiorari and which respondent's counsel argued fully, respondent does not feel justified in asking a general rehearing on those questions; but the cases are remanded for further consideration by the Court of Appeals, and it is hoped that the extent of that further consideration is not foreclosed by any implications from the opinion of this Court,—hence the perhaps unusual character of this application.

It seems that we should call attention, in a preliminary way, to a particular feature of the opinion which may seem to this Court of importance, as affecting the further proceedings. The Court selected claim 39 of the Gulick patent for discussion, so that the language of that claim served more or less as the basis upon which the Court reached its conclusions. *Claim 39 was not in suit and had never been presented to or considered by the Court below.* It differs materially from the claims which were in suit.

PART I.

(A) This Court said at the end of its opinion and just preceding the ordering clause, as follows:

> "We assume that it [meaning the Court of Appeals] sustained claim 1 of the Gulick patent which makes no mention of web flexibility, only by reading into it that element, which the Court regarded as an essential part of the invention." [1]

It has always been the rule that an element cannot be read into a claim.

This Court early stated the rule as follows, to quote the syllabus, in the early case of *McCarty v. Lehigh,* 160 U. S., 40 L. Ed. 358:

> "An element not mentioned in a claim for a patent cannot be read into the claim for the purpose of making out a case of novelty or infringement."

Since the Sixth Circuit Court of Appeals has followed this rule even in very recent decisions, many of which were written by Judge Simons, the same Judge who wrote the opinion in the instant causes (see *Smith v. Petroleum,* 73 F. (2d) 531, 536; *Wadsworth v. Westinghouse,* 71 F. (2d) 850; *Chicago v. Bade,* 63 F. (2d) 928; *Cincinnati v. English & Mersick,* 18 F. (2d) 542, 543), may not the Court of Appeals rightly feel that it should not have been thought to have read the web, flexible or otherwise, into claim 1 of Gulick, or to have read any element into any other claim in suit, where such element was not already in the claim, or rightly feel that

---

[1] To much the same effect are other statements in this Court's opinion such as that in the beginning of the same paragraph from which the last sentence was quoted and which is as follows:

> "we construe the Court's opinion as including the laterally flexible web as an essential element in the patented combination."

it really intended to hold the claims valid as they are and without reading any element into them?

Suppose, therefore, that the Court of Appeals *did not* read, or did not intend to read, the web or "web flexibility" or "laterally flexible webs" into claim 1 of the Gulick patent, for example. Should the Court of Appeals now be bound to assume that it *did* read the web or the web flexibility into claim 1 because this Court assumed (and, by hypothesis, erroneously) that the Court of Appeals had done so, or is it not more appropriate that the Court of Appeals be at liberty to proceed on the basis (by hypothesis, the true basis) that it *did not* intend to read that element into any of the claims?

To state the matter summarily, the Gulick and Maynard patents contain the following three kinds of claims:

(1) claims such as claim 1 of Gulick, which do not specifically recite any "web" at all,

(2) claims such as the claims of Maynard, and Gulick claims 11, 12, 13, 15, 18, 30, and 33, the other Gulick claims ruled upon by the Court of Appeals, which recite the webs, but do not recite the flexible feature of the webs, and

(3) claims like claim 39 of Gulick which were not in suit, but which recite both the webs and the flexible feature of the webs.

Only claims of the first two groups were presented for consideration and review in the Court of Appeals and it was only such claims that were considered. If the Court of Appeals read the web into the first group, or read the flexible feature of the web into the second group as an element, then that Court violated the rule of *McCarty v. Lehigh*. If the Court of Appeals did disregard that rule, then it seems to us that it should

be reversed *for so doing,* and be directed to reconsider the claims without reading elements into the claims in violation of the rule of this Court in *McCarty v. Lehigh* and the practice established thereby and followed since.

If the Court of Appeals followed *McCarty v. Lehigh* and did *not* read the web into the first group of claims and did *not* read the flexible property of the web or a flexible web element into the second group of claims, as this Court has assumed it did, then would not the Court of Appeals rightly feel that it should have an opportunity so to declare, and then to consider the claims as they read, and unembarrassed by any supposed "reading in" of the flexible feature of the web element?

In other words, as the matter stands, the respondent has had no review of the issue which was presented to the Court of Appeals [1] (the validity of the claims as they read), unless this Court is wrong in assuming that the elements were read into the claims by the Court of Appeals and, in that event, this Court has reversed the Court of Appeals on something that the Court of Appeals did not rule upon.

The matter is of special importance here, as this Court has ruled against respondent because of "lack of disclosure," in the specification, of matter which is not included in any claims passed upon by the Court of Appeals, and the claims thus ruled upon by that Court were based upon and justified by the original disclosure (Gulick and Maynard). No claim passed upon by the Court of Appeals contained or was based upon the mat-

---

[1] See reference to Claims 18 and 33 on p. 19, *infra,* which did not include web flexibility.

ter which this Court has found was not disclosed in the original specifications.

Would not the Court of Appeals rightly think that it would know whether or not it had read such elements into such claims, though in violation of the rule of *McCarty v. Lehigh,* well known to and practiced by that Court? *Is it not reasonable, under the circumstances, and from the viewpoint of the Court of Appeals that it should have the opportunity to say whether or not it had departed in the instant causes from the rule of McCarty v. Lehigh and its established and common practice of following that rule?*

A second assumption made by this Court regarding the holding of the Court of Appeals, as we understand this Court's opinion, was that the Court of Appeals regarded "the lateral flexibility of the webs" to be "the only feature mentioned not within the prior art or within the expected skill of the art" (see p. 5 of this Court's opinion). We respectfully urge that the Court of Appeals did not predicate patentable invention upon the novelty or lack of novelty of any one element of the combination, and that the Court of Appeals did not look upon any one element as the main point and gist of the invention; but rather that the Court of Appeals regarded the invention as residing in the whole combination of the various specified elements, whether individually old or new, and regarded the combination of elements defined in the claims passed upon as the essential thing constituting invention, as indeed the Court of Appeals said.

That this was the real view of the Court of Appeals seems to follow from its statement (92 F. (2d) 333):

> "The Gulick patent is *for a combination of elements,* many, *if not indeed all of which, are to be found in the prior art.* Nowhere, however, is found his precise organization, and the question at once presents itself as to whether there was exercise of the inventive faculty in the concept of their combination, for that a new result was achieved and a new mode of operation of an aluminum piston in its iron cylinder brought about is not successfully challenged on this record."

Not only was this view the one taken by that Court in the instant causes, but it had consistently so held in a long line of decisions, some of which are written by Judge Simons, and some by other Judges who sat in these causes below. In so ruling, the Court of Appeals has followed the rule early established by this Court (*Loom Company v. Higgins,* 105 U. S., 580; 26 L. Ed., 1177) and followed by this Court throughout (*Expanded Metal v. Bradford,* 214 U. S., 366; 53 L. Ed., 1034) to the effect that a new combination of old elements may be patentable no matter whether all of the elements are old, whether all but one are old, and whether part are old and part are new (*National v. Richardson,* 63 Fed. (2) 292; *International v. Remington,* 78 Fed. (2) 606 and *Monarch v. Dennison,* 92 Fed. (2) 90).

Moreover, that Court has consistently held and recently definitely reannounced that *no one element* in such a combination constitutes the invention or contributes novelty to the combination, but that it is the combination that constitutes the invention and that is novel. In other words, as has long been the rule, the combination of the elements makes *a new thing* that is separate and distinct from the individual elements of the

ombination. (*Automotive Parts v. Wisconsin,* 81 Fed. 2) 125, 126).[1]

Should it be assumed that the Court of Appeals did ot follow these rules of law in the instant causes? Does ot its opinion rather indicate that in the instant causes t regarded the *combination* of elements recited in the laims as *the new thing,* regardless of the novelty or ntiquity of any of the elements taken individually, and hat it found these combinations patentable because of he history of the inventions, their achievements, the new esults and the new mode of operation obtained by the ombination of elements defined in the claims sustained? —as indeed that court carefully and expressly said. Do ot the statements made by Judge Simons on pages 334 nd 335 of 92 Federal Reporter (2d) sufficiently estab- ish these conclusions?

Be these things as they may, is it not reasonable that he Court of Appeals should be permitted to say whether it regarded the inventions of the patents in suit o be found solely in the web flexibility,—the flexible veb,—or rather in the combination of elements recited n the claims sustained?

This question of the patentability of the claimed com- inations was not presented to this Court by the petition,

[1] Judge Moorman, speaking for the Court (Moorman, Simons and Allen) said:

> *"The invention is for a composite thing, embracing several elements or parts, all of which are necessary to and cooperate in the operation of the patented unit.* We cannot subscribe to the view that the test of contributory infringement in the furnishing of parts for a combination invention is whether the parts furnished constitute the gist or essence of the invention; indeed, *we cannot see how it may be said that any one element or another marks the advance step or is the essence of such an invention."*

and has never been duly brought before this court.[1] It becomes apparent upon a consideration of the opinion of the Court of Appeals that this question was determined by that Court only after a careful consideration of voluminous testimony regarding history, operations and achievements, as well as careful consideration of the patented and the prior art structures; and is it not true that such question cannot fairly be considered without a full consideration of this evidence?

At all events, is the situation so urgent that the Court of Appeals must be finally and forever assumed to have violated both of the cardinal rules of McCarty v. Lehigh and Loom Company v. Higgins, or should that Court be given an opportunity to make clear whether it did or did not so violate these rules,—especially when for years that Court has been consistently and carefully following these two rules so promulgated by this (the Supreme) Court in these two cases?

Moreover, since the causes are remanded to the Court of Appeals for further proceedings, these matters, we submit, should be clarified since they also bear upon the other subject-matter to be considered on the remand.

(B) As this Court said at page 2 of its opinion, the Courts in the District of Columbia relied upon the rule of sufficiency of disclosure followed in the "interference proceedings" which we will here call for short and for better convenience the "liberal rule"; at the same place, this Court found that the Master relied upon the rule of sufficiency of disclosure stated in the decisions of this Court in *Permutit v. Graver* and *Powers v. Concrete*,

[1] It was expressly disclaimed by petitioner's counsel on the oral argument.

which we will here call for short and for greater convenience the "strict rule."

The Court of Appeals used the first or "liberal rule" in its interpretation of the disclosures of both (1) the prior art and (2) the patents in suit. (Where we refer to the disclosure of the Gulick patent in this connection we mean the disclosure without the 1922 amendment.)

This Court rejected the application of the "liberal rule" to the patents in suit, reversed the Court of Appeals and the District of Columbia Appellate Courts and applied the "strict rule" to the patents in suit; on the other hand, this Court accepted the Court of Appeals' interpretation of the prior art which had been under the "liberal rule."

It results that the matter now stands decided with the patents in suit interpreted by the "strict rule" and the prior art interpreted by the "liberal rule."

This is wrong; both must be interpreted by the same rule, i.e., the "strict rule" under this Court's decision.[1]

---

[1] That the requirements for sufficiency of disclosure in the prior art are the same as for the patent in suit was early established and has since been followed by this Court.

In the *Cawood* patent case, 94 U. S. 695, this Court, speaking through Mr. Justice Strong, said (p. 704):

> "That, however, evades the question to be answered, which is, whether the specification was sufficient to enable a mechanic skilled in mechanical arts to construct and carry into practical use the Cawood machine; or, *in other words, whether whatever is essential to the Cawood machine could be read out of the prior specification.* We think no such information was given by the English patent."

In *Seymour v. Osborne*, 11 Wallace, 516, this Court, speaking through Mr. Justice Clifford said (78 U. S. 555):

> "Patented inventions cannot be superseded by the mere introduction of a foreign publication of the kind though of prior date,

For example, the Ebbs patent 700,309 (R. p. 1673), and the Long patent, 1,872,772 (R. p. 1773) are as barren of description of "flexibility of the skirt" which this Court considered to be disclosed by them (p. 4 of this Court's opinion) as the patents in suit are barren of description of "flexibility of webs,"—indeed more so. (See Appendix A and the cut adjacent the back cover of this brief.)

The Van Bever patent 1,031,212 (R. p. 1681) is likewise barren of description of flexibility of the skirt in the completed piston. It is true that this Van Bever patent refers to "spring capacity," but only in connection with the piston in its intermediate or incompleted stage.

---

unless the description and drawings contain an exhibit a substantial representation of the patented improvement, in such full, clear and exact terms as to enable any person skilled in the art or science to which it appertains to make, construct and practice the invention to the same practical extent as they would be enabled to do if the information was derived from a prior patent. Mere vague and general representations will not support such a defense, as the knowledge supposed to be derived from the publication must be sufficient to understand the nature and operation of the invention, and to carry it into practical use. Whatever may be the particular circumstances under which the publication takes place, the account published, to be of any effect to support such a defense, must be an account of a complete and operative invention capable of being put into practical operation. *Web. Pat. Cas.* 719; *Curt. Pat.* (3d ed.), sec. 278, a; *Hill v. Evans*, 6 Law. T., N. W., 90; *Betts v. Menzies*, 4 Best & S., Q. B., 999."

In *Downton v. Yeager Milling Company*, 108 U. S. 466, the rule was reaffirmed, to quote the syllabus:

> *"The doctrine reaffirmed that the earlier printed and published description of a subject of a patent which is put in evidence to invalidate a patent must be in terms that would enable a person skilled in the art or science to which it appertains to make, construct and practice the invention as completely as he could do by the aid of information derived from a prior patent*; and that unless it is sufficiently full to enable such person to comprehend

When completed, the "spring capacity" is *so locked as to destroy all flexibility.*

All of the other art discussed or mentioned by this Court and the Court of Appeals is barren of description of "flexibility of the skirt," unless that feature can be imported into the disclosure of such prior art patents through such words and phrases as appear in the descriptions of the inherently flexible webs of the patents in suit. (A more complete discussion of this subject is found in the Appendix A.)

None of the drawings of these prior art patents show dimensions, so that the drawings may not be resorted to

---

it without assistance from the patent, or to make it or repeat the process claimed, it is insufficient to invalidate the patent."

In *Eames v. Andrews,* 122 U. S. 40, the rule was followed (p. 66):

> "The same rule was repeated by Mr. Justice Strong in the opinion of the court in *Cohn v. United States Corset Co.*, 93 U. S. 366, 370, as follows: 'It must be admitted that, unless the earlier printed and published description does exhibit the later patented invention in such a full and intelligible manner as to enable persons skilled in the art to which the invention is related to comprehend it without assistance from the patent, or to make it, or repeat the process claimed, it is insufficient to invalidate the patent.' This rule was affirmed in *Downton v. Yeager Milling Co.*, 108 U. S. 466, 471."

The rule expressed by this Court in the above authorities has not only been followed throughout the Courts of Appeals and the District Courts, but it has become textbook law (see *Walker on Patents,* Deller Edition, pp. 270-272). Thus Walker says (p. 270):

> "Novelty is not negatived by any prior patent or printed publication, unless the information contained therein is full enough and precise enough to enable any person skilled in the art to which it relates, to perform the process or make the thing covered by the patent sought to be anticipated."

This, as well as the quotations copied from the opinions of this Court, are merely paraphrases of the Statute R. S. 4888 which this Court paraphrased in almost the same language at page 7 of its opinion in the instant causes.

in order to supply the omission, any more than in the case of the patents in suit. Indeed, most of the drawings of these prior art patents appear to be more indefinite than the drawings of the patents in suit, since the evidence shows that the drawings of the patents in suit proved to be scale drawings and there is no evidence that these prior art patents show scale drawings. Each of the parties used the drawings of the Gulick patent and produced the pistons plaintiff's Exhibit 20 and defendant's Exhibit 3-T (R. pp. 155, 156, 192, 193, 255, 256, 240, 568, 860 and 863),—both of which have flexible webs.

Nor can any of the prior art be rescued from the application of the "strict rule" by any admission made during the trial that any of them embodies what their disclosures omit, for there are admissions equally binding that the patents in suit disclose "flexibility of webs" to those skilled in the art (R. pp. 155, 156, 201, 240 and 568).

What we have said about the absence of disclosure of "flexibility of skirt" in the cited prior art under the "strict rule" applies to nearly all of the items which the Court of Appeals mentioned in discussing the Gulick invention at 92 Fed (2) 334, quoted by this Court at page 3 of its opinion and relied upon for the assumption that web flexibility must be read into the claims in suit.

We have analyzed this discussion and itemized the features recited therein. They are as follows:

"But to combine";

(1) "insulation of head from skirt"

(2) "retraction of the bosses from the skirt periphery"

(3) "connection of such bosses to the skirt with webs laterally flexible and"

(4) (connection) "yet so carried from the head as to support the load upon the wrist pin with sufficient strength and rigidity and"

(5) "to utilize the mechanical force of the cylinder wall upon the skirt"

(6) "and" (to utilize) "the thermal expansion of the bosses so as to compensate evenly and fully for head expansion and"

(7) "to secure a balanced flexibility of the skirt with no bending concentration at any point therein."

Except for item (1), which is disclosed in the text of the Spillman & Mooers patent, we find none of these items disclosed in any of the prior art patents to Ebbs, Van Bever, Franquist, Spillman & Mooers or in the subsequent Long Patent 1,872,772 of 1932, unless resort be had to the drawing or to the knowledge of the art, that certain properties would be inherent, to import them into one or more of such patents. Item (2) might be found in the Spillman & Mooers patent by referring to the drawing thereof, but there is nothing in the specification to support its presence. Item (5) might be imported into the Franquist disclosure to a degree too limited to be successful, as the record shows, if Franquist were favored with a liberal interpretation of language, now denied to Gulick and Maynard as we show in Appendix A. Items (3), (4), (6) and (7) are not only not found in these patents, but cannot be found there even if resort be had to the drawings and to any knowledge of the inherent properties of metals.[1]

[1] The combination of the elements or features cannot be found in any prior art disclosure even though resort might be had to drawings and inherent properties. Nor was it within the skill of the art as the many

When we come to Maynard we find that not only is what we have said about the Gulick items true, but the additional items named by the Court of Appeals as employed by Maynard, which are as follows:

(a) "webs about two-thirds of the length of the skirt"

(b) omitted the skirt for the length of the webs

(c) continued the skirt "circumferentially below the webs except for a single vertical slot throughout one bearing face of the skirt" (92 Fed. (2) 337)

are not to be found in the prior art cited by the Court of Appeals and this Court. Not only are they not disclosed in the specifications, but neither resort to the drawings nor to the knowledge of what is inherent in the constructions of such art justifies their importation into any item of this prior art, by either the "strict" or the "liberal" rule.[1]

Therefore, in common parlance, each of the prior art patents referred to by this Court and by the Court of Appeals "is in the same boat" with the patents in suit,

---

[1] The combination of the elements or features cannot be found in any prior art disclosure even though resort might be had to drawings and inherent properties. Nor was it within the skill of the art as the many efforts and failures in this country and abroad, not only by engineers but by mechanics skilled in the art amply establishes, as described by the Court of Appeals at 92 Fed. (2) 334 and 335 and throughout the record. As petitioner's expert said, "There was a crying demand for an aluminum piston that would work with a minimum clearance." (R. p. 458.)

(Continued from p. 15.)

efforts and failures in this country and abroad, not only by engineers but by mechanics skilled in the art amply establish, as described by the Court of Appeals at 92 Fed. (2) 334 and 335 and throughout the record. As petitioner's expert said, "There was a crying demand for an aluminum piston that would work with a minimum clearance." (R. p. 458.)

and since the rule is that "sauce for the goose is sauce for the gander" the "strict rule" must be applied to the prior art as well as to the patents in suit.

Since the causes stand remanded by this Court to the Court of Appeals on other questions, and since we have never had a review by the Court of Appeals of these causes on the basis of the "strict rule," we have, as an alternative to applying for a rehearing, made this motion to remand this question to the Court of Appeals along with the other questions already remanded to that Court and to which this question is closely allied. In doing this we have partly been actuated by a realization that it can, perhaps, be more economically and expeditiously done by the Court of Appeals which is already familiar with the prior art and need only reconsider it in connection with the "strict rule" of interpretation.[1] Moreover, it is apparent that at least some of this prior art, if not all of it, must be reviewed by the Court of Appeals in connection with the other questions already remanded to it.

We have adopted this course notwithstanding it makes it necessary for us in effect to ask this Court to tell the Court of Appeals to disregard this Court's statements regarding the prior art in this Court's opinion. We make this request with all deference; nevertheless, we are confident that this Court would not want the Court of Appeals to read "flexibility of the skirt"[2] into such patents as the Ebbs patent when, under the "strict rule," "flexibility of the web" cannot be read into the patents in suit. The disclosure of the Ebbs patent is to be found at page

---

[1] The Court of Appeals considered the prior art in connection with the question of invention, a question admittedly not before this Court.

[2] Or other feature.

1673 of the record. We invite the Court to consider the one page which embodies the whole disclosure. It will be readily seen that not only is "flexibility of the skirt" not disclosed, but it is not even contemplated.

The matter is important since only by applying the "liberal rule" and by thus importing matter into the prior art, could it be assumed that the disclosures of the prior art were sufficient to impose on the patented claims the limitations which result from reading in "flexibility of web." If the "strict rule" is applied to the prior art the matters imposing those limitations on the claims in suit are not found in the prior art. Therefore, if the "strict rule" is applied to the prior art, as well as to the patents in suit, the claims in suit are valid without reading "web flexibility" into them.

Even assuming that there could be any dispute on this question, it is a question which has never been reviewed by the Court of Appeals and should be considered by it.

We, therefore, ask this Court to direct the Court of Appeals to reconsider the claims of the patents in suit, applying the "strict rule" to each of the prior art patents, as well as to the patents in suit.

PART II.

Suggested Corrections in the Opinion.

(a) The Court says at the end of the first full paragraph on page 4:

> "Reference to the means, the webs, connecting the head to the split skirt as being 'yieldable' in response to lateral cylinder wall pressure appear in claims 18 and 33."

The term "yieldable," appearing in claims 18 and 33, applies to the *skirt* and not to the *webs*, as we read the

claims and as we understand that they have been read. The only place where the term "yieldable," or its equivalent, is used in either of these claims is in the following language.

In claim 18:

> "whereby said piston *skirt* is rendered yieldable during operation in response to cylinder wall pressure"

and in claim 33, after defining the *skirt* as having "oppositely positioned main bearing portions" the claim concludes:

> "and the other main bearing portion being separated from the head and split longitudinally between its connections to the bosses to render *said slit main bearing portion* yieldable in response to pressure from the engine cylinder during operation."

(b) On the first page of its opinion of November 7, 1938 this Court said that

> "Respondent is the assignee in trust, under a pooling agreement among a number of automobile manufacturers, of some eighty patents relating to pistons employed in internal combustion engines."

Only one automobile manufacturer is in the agreement; the others are individual inventors and makers of aluminum pistons. The sentence would be correct if it read:

> "Respondent is the assignee in trust, under a pooling agreement among a number of individual inventors, a number of piston makers and one automobile manufacturer, of some eighty patents relating to pistons employed in internal combustion engines."

(c) This Court said at page 6 of its opinion:

> "Neither drawings nor specifications give dimensions showing thickness or other proportions which might suggest a flexible structure."

and at page 9:

> "As already indicated, the omission from the specifications was not supplied by the drawings, which fail to disclose by dimensions the proportions of the webs."

There are two ways of giving dimensions and proportions in drawings, as is well known. One way, and the less common way, is to place the figures indicating the dimensions on the drawings. This practice was followed, for example, in the early Gulick drawing (R. pp. 1862 and 1363) and in the drawing of Exhibit 22 (R. p. 1339).[1] The other way, and the more common way, is to make the drawings "to scale," as it is called, so that one who wishes to reproduce what is shown in the drawings merely has to measure the dimensions of the parts to get their finite and relative dimensions and the proportions and relations of the parts to each other (see Appendix B).

One advantage of the scale drawing over the merely dimensioned drawing is that when the drawing is a scale drawing, the disclosure may be reproduced in the actual shape and size illustrated in the drawing, and also may be halved, doubled, tripled, or made to any size by merely halving, doubling, tripling, or otherwise consistently modifying the measurements of the parts as shown when the parts are scaled. Each Gulick and Maynard shows a "scale drawing." The

---

[1] Indeed, the dimensioned Gulick drawing shown at page 1363 was before Gulick's solicitor at the time his application was prepared (R. pp. 860, 861, 864 and 868), but because it was a scale drawing the dimensions were omitted as unnecessary and because, to a certain extent, they "litter up" the drawing and make it less clear, especially when the reference numerals necessary to the description in the specification are added to the dimensioned drawings.

record shows that if one scales the drawings of either Gulick or Maynard and reproduces a piston on that scale, modified by any factor, no matter whether it be one-half, one, two, or other number, a piston will result which will operate successfully in an internal combustion engine to perform the desired functions, including flexing of the webs (R. pp. 155, 201, 568). Both parties did, by copying the Gulick drawings, make Gulick pistons which do what is claimed for the Gulick pistons (Exhibits 3T and 20 and R. pp. 155 and 240), while the record shows that millions of pistons like the Maynard drawing were made and used successfully (R. pp. 68, 71, 77, 78, 81, 88, 130, 132, 135, 462, 471 and 955).

We think it would be helpful in the further prosecution of this case in the Court below if this Court would say whether it is sufficient to follow the practice of showing scale drawings, or a drawing that can be scaled to produce the device, or whether the inventor must show the dimensions of the parts in his patent drawings.

If dimensions must be used, are those who followed the scale drawing practice in the past and did not show dimensions but, on the contrary, showed "scale drawings," to be penalized for doing so?

It follows that the matter is of general importance, as well as of special importance to these causes.

All we ask this Court to do, in Part I of this motion, is to give the Court of Appeals during the remanded proceedings an opportunity to say whether or not they have continued to follow this Court's rulings, and for leave to apply the same rule of interpretation to the patents in suit and the prior art alike.

Wherefore it is prayed that each of the foregoing motions be allowed.

PETITION FOR REHEARING.

Petition for Rehearing and in the event that any of our motions hereinbefore presented are denied, we pray this Court for a rehearing on the questions presented by the motions denied and for the reasons stated therein for the allowance of such motions, which reasons succinctly are as follows:

A.

(1) The Court of Appeals could not have read web flexibility, or the like, into any claim in suit, for to have done so would have violated a cardinal rule of patent law long since promulgated by this Court and always followed by the Court of Appeals even down to recent decisions written by Judge Simons himself.

(2) The Court of Appeals could not have predicated patentability upon web flexibility, or any other one element or feature of the novel combinations, for to have done so would have been to have violated a cardinal rule of patent law long since promulgated by this Court and always followed by the Court of Appeals even down to recent decisions written by Judge Simons himself and declared by the Court of Appeals to be followed in the instant causes (92 Fed. (2) 333).

(3) Even if scale drawings are no longer acceptable in patents, but must be dimensioned, the patent drawings which are scale drawings and included in the patents already issued should not be discarded, but should be relied upon since they have always been relied upon in the past and were relied upon when the patents in suit were issued.

(4) The "strict rule" of interpretation of a patent disclosure made by this Court in its opinion in these

causes and in *Permutit v. Graver* and *Powers v. Kennedy*, as now interpreted, should be applied to the prior art as well as to the patents in suit since it has always been the rule that the same rules of sufficiency of disclosure apply to both alike. As the case now stands, the "strict rule" has been applied to the patents in suit and the former "liberal rule" to the prior art. If the "strict rule" is applied to the prior art as well as to the patents in suit, the same end will be reached as was reached by the Court of Appeals in applying the "liberal rule" to each the patents in suit and the prior art, for the reason that if the "strict rule" is applied to the prior art there will be no prior art to impose upon the claims limitations requiring the reading of web flexibility into them.

B.

Is not the "strict rule" inconsistent with what is commonly and generally accepted in the art as a disclosure sufficient to teach those skilled in the art all the statutes require?

In view of the fact that the "strict rule" of disclosure which this Court has now made and upon which this Court stands is contrary, as the opinion of this Court says, to so many tribunals, including the three Courts of Appeals, we ask a rehearing that we may invite this Court to consider disclosures of pistons which those skilled in the piston art have considered to be such full, clear, concise and exact terms as to enable any person skilled in the art to construct and use a new piston, and what those skilled in the art considered to be a sufficient explanation of the principle of a piston and the best mode in which it is to be applied and how it is to be distinguished from other

pistons, to paraphrase the language of Section 4888, as this Court did at page 7 of its opinion.

The record contains a number of articles prepared by those skilled in the piston art and either read by them at engineering societies, or published in journals, or both, which articles were compiled for the purpose of disclosing the pistons there discussed in such full, clear, concise and exact terms for the purpose of teaching their readers or auditors to construct the pistons and which articles have explained the principles and the mode of using the pistons, etc. *In other words, we have here many practical demonstrations of what the piston art not only considers sufficient to disclose a piston, its principle, etc., but what has actually been sufficient for that purpose.*

We will take these up in order as they appear in the record. They are as follows:

(1) At page 1647 of the record there is an article by Harry R. Ricardo, B.A., A. M. I. C. E. No one can challenge the standing of Mr. Ricardo in the automotive industry. No one can challenge his skill in that industry or his knowledge of what constitutes a sufficiency of disclosure to those skilled in the piston art. An inspection of that article shows that his disclosure is more meager than the disclosures of the patents in suit. His drawings are not dimensioned and his descriptive matter contemplates resort to the drawing as sufficient. His drawings are no more elaborate than those of the patents in suit and his description is much more meager.

(2) At pages 1667 to 1669 of the record there is an article by the well-known automobile engineer, E. G. Gunn, which is reprinted in several automobile journals. *Mr. Gunn uses a little over two pages to illustrate and*

describe eleven different pistons. His drawings are not dimensioned though he relies largely upon the drawings for his disclosures. It is significant that he discusses a Long type of piston which has been said in these causes to have flexible webs. He considered it sufficient description to say that the piston of this type was allowed "to spring" without mentioning that the spring is due to the flexibility of the webs or is in the webs, or is in the skirt.

(3) There are two articles at pages 1827 to 1834 of the record describing machinery and including a description of pistons. Again drawings are relied upon. The only dimensions employed are shown at page 1828 and only the overall dimensions are given to show the size of the piston for a certain cylinder. Dimensions of wall thicknesses and such things are not given. These articles, like the Gunn article and the Ricardo article, are addressed to those skilled in the art and considered to be sufficient to disclose the pistons to those skilled in the art so as to enable the art to reproduce them and to realize their principles of operation.

(4) At pages 2229 to 2235 there are other articles published relating to pistons including the Spillman & Mooers piston. Again we find undimensioned drawings accompanied by description much more brief and barren of detail than the descriptions of the patents in suit, yet these are disclosures which the authors, who were skilled in the art, considered sufficient to convey to their readers, also skilled in the art, the information to enable them to reproduce the pistons and to take advantage of their principles of operation.

(5) At page 2271 of the record there is a publication by Mr. Long himself addressed to garagemen, mechanics,

engineers and others in the art for the purpose of explaining his piston to them and its principle of operation so as to induce them to employ it. It will be noted that Mr. Long relies largely upon an undimensioned illustration of his piston and that in order to explain the operation of the piston,—which is now thought by this Court to include web flexibility,—he considered it sufficient to tell the art that the piston permitted "expansion"—a word used by both Gulick and Maynard in their disclosures, but in more elaborate context. There can be no doubt that Long is skilled in the art, and that his disclosure was addressed to those skilled in the art, with the intention of informing them of the structure of his piston and how to operate it.

(6) At pages 2273 to 2275 of the record there is an article by a Mr. Walford, and addressed to those skilled in the piston art, where he describes a split type of piston, relying largely upon an undimensioned drawing. He did not consider it necessary to mention the fact that the portions of the piston would expand or that the material of which it was made was resilient; yet his purpose was to disclose to those skilled in the art his piston and its principles.

(7) Even more abbreviated are the disclosures by Sterling Products Corporation at page 1326 of the record and by Weems, the licensee of Long, at page 1621 of the record.

Each and every one of these disclosures was offered in this record by the petitioners, who urged that the disclosures were sufficient to teach those skilled in the art how to make the pistons illustrated and described in these articles and how to operate them to make their principles available to the public.

We, therefore, wonder if this Court would not, upon reconsideration, think that the former or "liberal rule," as we have called it, was more consistent with the actual facts and the practical side of the piston business and science than the "strict rule," and, further, and if this Court would not think that the "strict rule" was inconsistent with and more or less flies in the face of what the art considers to constitute a disclosure sufficient to those skilled in the art, as so amply established by the publications to which we have referred.

The authors of this brief are familiar with the literature on pistons made up of disclosures in textbooks, engineering society papers, read and discussed at engineering society meetings, articles published in scientific and trade journals, etc., such as are found in any modern science or art. We regard the articles appearing in the record in these causes which we have discussed above as typical of the literature and of what has not only been regarded by those in the art, but has been in experience found by those in the art, to be sufficient to disclose the pistons, their principles of operation and how to apply them. We do not believe that the literature of the piston science or the piston art contains a description that would conform to the rule made by this Court in its opinion in the instant causes.

WHEREFORE, it is prayed this Court grant a rehearing in the above entitled causes.

Respectfully submitted,

ARTHUR C. DENISON,
F. O. RICHEY,
WM. C. MCCOY,
Attorneys for Respondents.

November 30, 1938.

I certify that the foregoing Petition for Rehearing is filed in good faith and not for purposes of delay.

WM. C. MCCOY.

APPENDIX A.

The Ebbs piston (this Court's opinion, p. 4) not only does not describe "flexibility of the skirt," but the purpose for which Ebbs showed replaceable skirt portions did not contemplate flexibility in the skirt portions. All that Ebbs provided was skirt portions which could be removed when worn and new ones substituted. He contemplated no skirt flexibility and in the use for which his piston was designed there would have been no skirt flexibility (R. p. 945). We presume that it might be argued that since all metal is inherently flexible, the parts would have flexed if somebody had taken them out of the cylinder and put enough pressure on them to make them flex, but under the rule of this Court expressed in its opinion of November 7, 1938, this flexibility could not be imported into the Ebbs patent. Nor can any of the other seven items of Gulick or ten items of Maynard be read into Ebbs, if for no other reason than that they are not there disclosed under the "strict rule."

The Van Bever patent does not show "flexibility of the skirt." The most that Van Bever claims is that the skirt portions "have a certain amount of springing capacity." *This "springing capacity" does not exist when the piston is completed; it is present only in the incompleted piston.* It is employed only for the purpose of permitting the manual adjustment of the piston skirt when it is outside of the engine. The Van Bever piston, therefore, not only does not possess "flexibility of the skirt," but the "springing capacity" present in the incompleted piston does not contribute to automatic adjustment of the piston skirt to take care of the expansion and contraction. The Van Bever piston does not automatically contract and expand when in use; it is just as dead and as rigid as a trunk piston. The skirt does not flex when it is in use. It was merely intended to be flexed when the piston was taken out of the cylinder and adjusted by hand. The record further shows that the ad-

justing means was omitted from the Van Bever piston and that it was used in a cylinder in an attempt to make it flex and take care of the expansion and contraction taken care of by the pistons of the patents in suit. The record shows, however, that it would do no such thing, and, further, that it was incapable of flexing to do what is done by the pistons of the patents in suit and was given up as a failure (R. pp. 452, 546-548, 572 and 930). The principal testimony on this subject was given by defendant's expert who made the attempt and experienced the failure when he was an engineer and later the Chief Engineer of the Franklin Company (R. pp. 449 and 543). The seven other Gulick and ten other items of Maynard cannot be read into Van Bever, under the "strict rule."

At the threshold of the consideration of these questions, it must be remembered that there are various kinds of flexibility. For example, a springboard is flexible; so is a thread, but the kind of flexibility possessed by the thread would not serve in the springboard and the kind of flexibility in the springboard would not serve in the thread.

To import into the completed Van Bever patent flexibility that it does not possess and that the evidence shows it is incapable of possessing, would not only violate the rule laid down by this Court in its opinion of November 7, 1938, but would violate the long established cardinal rule of patent law that two things are not the same, even though a word can be discovered which describes them both, where the one is incapable of performing the offices of the other or performing those offices in the same way, such, for example, as the springboard and the thread, and the Van Bever piston and the patented pistons (See *Machine Co. v. Murphy*, 97 U. S. 120, 125).

The Franquist patent No. 1,153,902 does not disclose "flexibility of the skirt." If it attains flexibility it is only by virtue of undisclosed antithetical properties inherent in

the materials of which the piston is made and, even then, as we shall point out later, flexibility would be achieved by a different mode of operation and to a too limited extent to be commercially successful. It is true that the Franquist patent prophesies that the Franquist piston will be circumferentially compressible under the pressure of the cylinder wall and when the cylinder retires the piston will resume its normal size, just as Gulick, in his original specification, claimed that his piston would not "expand against the cylinder wall to such an extent as to seize or stick" and with not enough force "to cause the piston to stick in the cylinder." *Franquist no more describes the properties of the materials of which his piston is made whereby this can be done than Gulick did in his original specification.* Franquist says that his piston will operate by circumferential compression, just as Gulick says that his piston will not expand against the cylinder wall with too much pressure, but Franquist no more states what property of the metal he employs or the actual dimensions used which cause his piston to yield to circumferential compression than Gulick did in his original specification. In other words, Franquist depended upon flexibility to accomplish his purpose of yielding in response to circumferential compression and resuming the normal size when the pressure was relieved, just as Gulick is said to have depended upon flexibility of the web. There is no doubt that whatever flexibility is present in Franquist's skirt is antithetical for the same reason that flexibility in Gulick's web is antithetical. Franquist's skirt possessed rigidity if it possessed flexibility, just as Gulick's web did. The situations with respect to the Franquist skirt is precisely what this Court said about the Gulick web, and if Gulick's original disclosure was insufficient because he neglected to mention the inherent antithetical property of flexibility in his web through which aid was given to the

ability of the piston not "to expand against the cylinder wall to such an extent as to seize and stick," then by the same rule and measure the Franquist patent disclosure is insufficient for failure to state that it is through the antithetical property of flexibility that the skirt can yield to circumferential compression and resume its original position when the circumferential pressure is relieved. In addition to that we will point out that Gulick did operate as he claimed to produce a useful piston and Franquist did not.

What we have said about the comparisons we have made between Franquist and Gulick applies likewise between Franquist and Maynard. Maynard states that his structure "compensates for expansion and permits the skirt to conform to the cylinder," just as Franquist claims that his skirt yields to circumferential compression and then resumes its normal size when the pressure is relieved. *If the Maynard description is insufficient because it neglected to mention the inherent antithetical property of flexibility, through which the compensation to which he refers is aided, then the disclosure of Franquist is insufficient because he fails to do the same thing.*

It follows that the Franquist patent cannot be used to limit either the Gulick or Maynard claims in suit so that web flexibility must be read into them to make them valid.

Nor can Franquist's drawings any more rescue his disclosure from the ban than can the drawings of Gulick and Maynard, because neither the drawings nor the specification of Franquist "gives dimensions showing thickness or other proportions which might suggest a flexible structure" any more than Gulick or Maynard do.

Franquist cannot be rescued from this situation by the claim that it was demonstrated that his piston would be flexible if made according to the drawing because the same thing has been shown of Maynard and Gulick. Moreover, there is no evidence that anyone knew that Franquist was

flexible prior to the inventions of Gulick and Maynard, and there is ample evidence that both Gulick and Maynard were known to be flexible long prior to the infringement.

The Franquist patent contemplated expansion and contraction upon a different mode of operation called in the Franquist patent "circumferentially compressible" and in this record and in the opinion of this Court and in the opinion of the Court of Appeals as "the accordion principle." On this principle, as the record shows, only limited contraction and expansion could be realized and that limited expansion and contraction was insufficient to improve upon the ordinary trunk type of piston which was superseded by the pistons of the patents in suit because they did operate upon a different principle than that of Franquist and failed. Therefore, we say that under the ruling of this Court in its opinion in these causes, the accordion principle cannot be read out of Franquist and the cantilever principle be read in. We also say that there cannot be *imported into Franquist sufficient flexibility* to be commercially operative and successful when the record shows that the amount of expansion and contraction actually disclosed and realized is insufficient to be either commercially operative or successful. Franquist fails to disclose the other items of the Gulick and Maynard itemization under the "strict rule," as we have shown *supra.*

The Long Patents (this Court's opinion, p. 4) instead of disclosing flexibility, disclosed rigidity both in skirt and web.

The Long patent shows a plurality of skirt portions 6 each of which, as the specification of the Long patent 1,872,772 says, "is held in its peripheral position by an integrally formed connecting portion 10" (R. p. 1737, ls. 54 and 55) and "the separated portions 6 will be *rigidly* held against bending" (R. p. 1738, ls. 32 and 33). The only way in which these sections 6 can be rigidly held in this manner is by the

provision of rigid webs 10; in other words, in Long the webs 10 could not both bend and hold the portions 6 rigidly against bending as stated. Moreover, this declaration that these skirt portions are held against bending, negatives any claim that they bend in operation; *in other words, according to the Long specification neither the skirt portions nor the webs are flexible.*

These statements and the facts recited therein cannot be overcome by any claim that Long had his piston in commercial use early enough to be prior art to Maynard—though not to Gulick—on the theory that there was an admission that the Long web was flexible because it was never admitted that the Long web was flexible enough to flex in use.[1] Such a statement would not only have been contrary to the teachings of the Long patent, but it would have been contrary to the experience of the Franklin Company with the Long piston. The record shows that the Franklin Company had to give the Long piston .004" to .005" clearance, from which it is clear that it could not be used at .002" clearance. It was equally clear that the reason that it could not be used with less than .004" to .005" clearance was because the webs would not flex in use (p. 458). If they had flexed in use the piston could have been used at .002" clearance. For the reasons we have said *supra*, other features listed by this Court and the Court of Appeals in discussing Gulick and Maynard cannot be imported into any of the Long patents, under the "strict rule."

---

[1] If the failure of a prior art patentee to disclose inherent flexibility in his patent, or to recognize it in his structure, can be cured by an admission made after the patented inventions were made, that flexibility would be present, then the failure of the Gulick and Maynard patents to disclose the flexibility in their original disclosures is cured because there are admissions here that flexibility is present in their disclosures supported by proof of the fact and, in the case of the Maynard patent, by proof of the use of millions of his pistons. (R. pp. 201, 568, 578, 462, 471, 955.)

The only other prior art piston that was mentioned either by this Court or by the Court of Appeals in connection with the dissection of the combination claim into its individual elements was the Spillman & Mooers patent. The Spillman & Mooers patent does not say that the Spillman & Mooers skirt is flexible. Under this Court's rulings these terms could not be *imported into Spillman & Mooers* even if it were possible to have flexed either web or skirt in the Spillman & Mooers construction.

APPENDIX B.

The drawings of the patent in suit each are scale drawings. The shape and proportions of each part of the webs of both Gulick and Maynard pistons are clearly shown in the drawings together with the exact position of these webs in the piston structures. In Gulick, for example, the shape or form of the webs is shown in plan view in Fig. 1, the thickness of the webs is shown in edge view in Fig. 2, the thickness of the webs is again shown in sectional view in Fig. 3, and in the sectional view in the plane of the bosses in Fig. 4. No such complete and accurate showing of any piston structure of the prior art is found in this record. Any mechanic could exactly reproduce in the piston structure the relative size, the form, thickness, and all other proportions of these webs and each of the parties did reproduce the piston of the Gulick patent, including the webs, and each structure so reproduced by the parties has webs that are extremely rigid in the direction of the web and that are also laterally flexible, as may be determined by manually squeezing the pistons Exhibit 3-T (Petitioner's) or Exhibit 20 (Respondent's) to close the longitudinal slots in those pistons. The drawings of the Gulick piston are found at R. p. 284 and of Maynard at R. p. 300. For convenience the piston of the Gulick patent is reproduced in perspective from the patent drawings in the proportions of the patent and is shown in the plate at the back of this brief. Arrows "a" and "b" are applied to this drawing to show the directions of the "extremely rigid" web connection between the power-transmitting bosses 16 and the piston skirt that is "in addition to" the split skirt that will not "seize or stick." Arrow "c" shows the "lateral flexibility" described in the amendment and that permits the originally described operation of the split skirt.

pp. 1-4.

SUPREME COURT OF THE UNITED STATES.

Nos. 3, 4, 5.—October Term, 1938.

The Schriber-Schroth Company, Petitioner,
vs.
The Cleveland Trust Company, Chrysler Corporation.

The Aberdeen Motor Supply Company, Petitioner,
vs.
The Cleveland Trust Company, Chrysler Corporation.

The F. E. Rowe Sales Company, Petitioner,
vs.
The Cleveland Trust Company, Chrysler Corporation.

On Writs of Certiorari to the United States Circuit Court of Appeals for the Sixth Circuit.

[November 7, 1938.]

Mr. Justice Stone delivered the opinion of the Court.

The principal question for decision is whether the court below rightly sustained the validity of two patents by including in the combination constituting the alleged invention of each an element which was not in terms described in one, and the description of which in the other was added only by amendment to the application after it was filed.

"Respondent, the Cleveland Trust Company, is the assignee in trust of some eighty patents relating to pistons of the type employed in internal combustion engines for automobiles, under a pooling agreement to which an automobile manufacturer and a number of manufacturers of pistons are parties."

was tried before a special master who, upon the basis of elaborate findings, held that the Gulick patent, No. 1,815,733, applied for November 30, 1917 and allowed July 31, 1931, was invalid for want

of invention and because of the addition to the application by amendment in 1922 of a new element of the alleged invention. In reaching this conclusion he relied on this Court's decisions in *Powers-Kennedy Co.* v. *Concrete Co.*, 282 U. S. 175 and *Permutit* v. *Graver Corporation*, 284 U. S. 52, as inconsistent with the result of interference proceedings in which Gulick's amendments were sustained, *Long* v. *Gulick*, 17 F. (2d) 686, *Hartog* v. *Long*, 47 F. (2d) 369. The master also held that the Maynard patent No. 1,655,968, applied for January 3, 1921 and allowed January 10, 1928, was invalid for want of invention and for failure to describe and claim the alleged invention. He held invalid upon various grounds the other patents, which are not presently involved.

The District Court adopted the findings and conclusions of the master and gave its decree for petitioners. The Court of Appeals for the Sixth Circuit reversed, as to the Gulick and Maynard patents only, holding that they were valid and infringed. 92 F. (2d) 330.[1] As the court regarded the claims which it sustained as basic and thought that a full recovery could be had by respondent under them, it did not pass upon the validity of the other patents or decide other questions involved in the appeal.

Petition for certiorari raising the question, among others, whether the Court of Appeals had erred in holding patentable a combination including one element not described in the original application for the Gulick patent and later added to it by amendment, and not described at all in the Maynard patent, was at first denied, there being no conflict of decision. 303 U. S. 639. We later granted certiorari, — U. S. —, on a petition for rehearing showing that, notwithstanding the doubtful validity of the patents, litigation elsewhere with a resulting conflict of decision was improbable because of the concentration of the automobile industry in the sixth circuit. Cf. *Paramount Publix Corp.* v. *American Tri-Ergon Corp.*, 294 U. S. 464; *Altoona Publix Theatres, Inc.* v. *American Tri-Ergon Corp.*, 294 U. S. 477.

It is important for the proper functioning of the piston in a gas engine that it should fit the explosion chamber closely so as to conserve power, prevent the passage of lubricating oil around the piston into the chamber, and insure the smooth and noiseless move-

[1] The decree sustained Gulick's claims numbered 1, 11, 12, 13, 15, 18, 30 and 33, and Maynard's claims numbered 1, 6 and 8.

ment of the piston within the cylinder. In designing gas engines for automobiles and other purposes requiring a high speed piston reciprocation with the accompanying development of high temperature in the explosion chamber, it is desirable to avoid thermal expansion of the close fitting piston, which will result in loss of power and possible injury to the mechanism through increased friction, which may cause the piston to seize or stick. The danger of undue expansion is increased when, as is advantageous in automobile engines, the piston is of aluminum, which has a higher coefficient of expansion than the iron or steel chamber within which the piston moves.

Both the Gulick and Maynard patents are for combinations in the structure of a piston for gas engines designed to prevent or restrict undue expansion of the piston when in operation. The Gulick patent exhibits a piston in which the ring-carrying head is separated by an air space at its periphery from the cylindrically shaped skirt or guide wall, whose surface engages the inner surface of the cylinder. The piston head and skirt are connected by two "webs" or walls extending longitudinally through the interior of the skirt. The webs are pierced at right angles for wrist pin bearings and support, at the bearings, piston pin bosses formed with integral flanges extending laterally from their respective bosses to form the webs, which in turn are integrally connected on either side with the interior wall of the lower part of the skirt and at their ends with the piston head. The skirt is longitudinally split on one side at a point in its circumference approximately midway between the pin bosses, with the edges of the skirt formed by the split separated so as to admit of the free movement of the edges toward each other.

The structure is thus designed to minimize the expansion resulting from high temperatures developed in the chamber and to avoid the effects of thermal expansion of the skirt. The webs, which afford at the wrist pin bearings the means for connecting the piston rod with the piston, serve to hold the head and skirt in proper relation to each other so that the air space between them retards flow of heat from the head to the skirt, undue expansion of the skirt, and the consequent increase of friction between piston and enveloping cylinder. Undue expansion of the piston is said by the patent's specifications to be avoided by the separation of the skirt by the longitudinal split in order to admit of unrestrained move-

ment of the edges of the skirt toward each other. Elsewhere they state that "when the longitudinal split is used, as shown, the web structure has sufficient lateral flexibility to permit the split to close more or less under the action of the expansion forces incident to the heating of the piston."

The elements of the combination as enumerated in Claim 39 are: "A piston, open at one end, for an engine cylinder comprising a skirt and head separated from the skirt wall around its entire periphery, said skirt being longitudinally split to render the skirt wall yieldable on every diameter in response to cylinder wall pressure, wrist pin bosses, and means rigidly connecting said bosses to the head and yieldingly connecting said bosses to the skirt whereby said skirt is yieldable in response to cylinder wall pressure."

"Reference to a combination including, with other elements, web connections, 'whereby said piston skirt is rendered yieldable during operation in response to cylinder wall pressure,' appears in Claim 18."

by an air space, the two being connected by webs supporting wrist pin bearings with bosses which do not come directly in contact with the walls of the skirt, was plainly foreshadowed by the prior art as a practicable means of minimizing the flow of heat from head to skirt and of securing lateral flexibility in the skirt. The expired Spillman and Mooers patent No. 1,092,870, of April 14, 1914, pooled with the patents in suit, showed a piston with head separated by an air space from the skirt, the two being connected by a web separated from the skirt except at the point of integral connection with it at the lower end of the cylinder, and providing bearings for a wrist pin connection with bosses not in direct contact with the wall of the skirt.

Flexibility of the skirt attained by longitudinal slits was old, as shown by the Ebbs patent No. 700,309 of 1902, and Van Bever, No. 1,031,212 of 1912. The Franquist piston, patent No. 1,153,902 of 1915, another of the pooled patents, which showed piston head partially separated from skirt by air spaces, attained flexibility of the piston wall by longitudinal grooves in the skirt which interrupted its outer periphery though connected at the inner edges of the groove by a fold of the metal on the accordion principle. The Long piston, patent No. 1,872,772 of 1932, which the master and the district court found was in commercial use from 1917 on, and before the amendment of the Gulick application, presently to be dis-

cussed, showed longitudinal slits cut through the skirt, which was separated by air spaces from the piston head, the two being connected by parallel webs pierced for wrist pin bearings.

The court below found invention in the Gulick disclosure in a combination of elements, of which one was webs "laterally flexible", which were not specifically so described in the Gulick application until the amendment of 1922. Conceding that the deceleration of the flow of heat from head to skirt by an air gap might be an obvious expedient of the art, and that to slit the skirt vertically so as to compensate for thermal expansion might not be beyond the skill of the art, the court added: "But to combine insulation of head from skirt, retraction of the bosses from the skirt periphery, connection of such bosses to the skirt with webs laterally flexible and yet so carried from the head as to support the load upon the wrist pin with sufficient strength and rigidity and to utilize the mechanical force of the cylinder wall upon the skirt and the thermal expansion of the bosses so as to compensate evenly and fully for head expansion and to secure a balanced flexibility of the skirt with no bending concentration at any point therein, discloses we think a meritorious concept beyond the reach of those skilled in the art." 92 F. (2d), at 334.

We can find no support in the opinion for the contention of respondent that the Circuit Court of Appeals did not consider the flexible web an essential element in Gulick's invention. Its enumeration, among other named elements, of the connection of head and skirt by webs laterally flexible as embodying a meritorious concept must be taken to indicate that the court regarded the flexible webs as a part of the invention, the more so since it indicates that lateral flexibility of the webs is the only feature mentioned not within the prior art or within the expected skill of the art. It rejected, on the authority of *Long* v. *Gulick, supra*, and *Hartog* v. *Long, supra*, the contention made below and pressed here that Gulick's application as filed did not disclose "webs laterally flexible" and the resultant "balanced flexibility of the skirt," and that those features were added to specifications and claims after the use of the Long piston and after they had appeared in Hartog.

The Gulick application, which was filed November 30, 1917, contained no reference in terms to laterally flexible webs or to the function of the webs in securing flexibility of the skirt. The

specifications pointed to no inadequacy in the structure or function of webs of the prior art which would be remedied by the webs specified and to no function to be performed by them other than as a means of connecting and holding head and skirt so as to maintain the air gap between them and to support the wrist pin bearings and their bosses as both were shown in Spillman and Mooers. On the contrary, Gulick's application described the webs as "extremely rigid" and stated that an object of the invention was "to rigidly support the piston pin bosses of a piston from the piston walls." The only description of the web structure was as follows:

"It will be seen that in addition to providing a piston with a split skirt the above described construction also provides an extremely rigid connection between the piston pin bosses and the skirt of the piston, which construction may be used either with or without the split skirt and separated head. The arrangement of the supporting flanges 17 between the ends of the piston pin bosses and the connection of those flanges with the piston skirt provide a particularly strong support for the bosses."

The webs as shown by the drawings conform to the specifications of an "extremely rigid connection" between piston pin bosses and skirt and "a particularly strong support for the bosses." They form chords subtending the arc of the circle of the skirt, with flanges depending from the head to the bosses at right angles to the webs, and the skirt as shown is provided with interior corrugations and with an inturned flange at the bottom, all familiar devices for securing rigidity of structure. Neither drawings nor specifications give dimensions showing thickness or other proportions which might suggest a flexible structure.

In 1922, after the Long piston, whose webs concededly were laterally flexible, was in commercial use, and Hartog, to the knowledge of Gulick's assignee, had specified and claimed a yieldable web, Gulick copied the Hartog claim and amended his specifications so as to state that one of the objects of his invention was "to rigidly support the piston pin bosses of a piston from the piston wall against mechanical load thrust from the connecting rod without interfering with the yielding characteristics of the skirt in response to cylinder wall pressure." And he amended his description of the web structure to read:

"The arrangement of the supporting flanges 17 between the ends of the piston pin bosses and the connections of those flanges with both the piston guide portion and the head provide a particularly strong construction, and at the same time, when the longitudinal

split is used, as shown, the web structure has sufficient lateral flexibility to permit the split to close more or less under the action of the expansion forces incident to the heating of the piston."

Petitioners insist that the flexible web element of the Gulick combination, as found and sustained by the court below, is excluded from the Gulick patent by reason of his failure to describe that element in his application as filed and that he could not cure the omission and secure a patent embodying that feature by substituting by way of amendment "webs laterally flexible" for "extremely rigid webs" in the description of his invention. The statute, R. S. § 4888, provides that the application which the inventor must file as a prerequisite to a patent shall contain "a written description of [his invention] . . . and of the manner and process of making, constructing . . . and using it in such full, clear, concise, and exact terms as to enable any person skilled in the art . . . to . . . construct . . . and use the same; and in case of a machine, he shall explain the principle thereof, and the best mode in which he has contemplated applying that principle, so as to distinguish it from other inventions. . . ."

The object of the statute is to require the patentee to describe his invention so that others may construct and use it after the expiration of the patent and "to inform the public during the life of the patent of the limits of the monopoly asserted, so that it may be known which features may be safely used or manufactured without a license and which may not." *Permutit Co.* v. *Graver Corporation*, 284 U. S. 52, 60. It follows that the patent monopoly does not extend beyond the invention described and explained as the statute requires, *Permutit Co.* v. *Graver Corporation*, *supra*, at 57; that it cannot be enlarged by claims in the patent not supported by the description, *Snow* v. *Lake Shore Railway*, 121 U. S. 617; cf. *Smith* v. *Snow*, 294 U. S. 1; and that the application for a patent cannot be broadened by amendment so as to embrace an invention not described in the application as filed, at least when adverse rights of the public have intervened. *Railway Co.* v. *Sayles*, 97 U. S. 554, 563, 564; *Powers-Kennedy Co.* v. *Concrete Co.*, 282 U. S. 175, 185-186; cf. *Webster Electric Co.* v. *Splitdorf Electrical Co.*, 264 U. S. 463; *Permutit Co.* v. *Graver Corporation*, *supra*; *Crown Cork & Seal Co.* v. *Gutmann Co.*, 304 U. S. 159.

Respondent earnestly argues, as both courts held in the interference proceedings, *Long* v. *Gulick*, *supra*, and *Hartog* v. *Long*,

supra, that the changes in Gulick's application were not alterations in the description of his invention but were at most a permissible clarification of its description of the flexible web element which was present, or at least plainly suggested, in the specifications and drawings of the Gulick application. Flexibility, it is said, as is well known to those skilled in the art, is an inherent property of the metal out of which the webs are made, and in consequence reference to the webs in the application as filed was sufficient to import into it as a part of the description of the invention their known quality of flexibility, a description which was made more specific, but not altered, by the amendments. The argument suggests that it was but the skill of the art, and not invention, to substitute a flexible for a rigid means of connecting head and skirt in a known combination of piston head separated from a slitted skirt by an air space and connected by webs. But in any case we think it falls short of establishing that the Gulick amendments were not new matter beyond the scope of the device described in the application as filed.

The properties of any given material are many and diverse. The antithetical qualities of rigidity and flexibility of a structure are not absolute but relative; it may be more rigid than some and more flexible than others; too rigid for some purposes and too flexible for others. The one quality may be increased and the other diminished by choice of materials from which the structure is made and by variation in its proportions. If invention depends on emphasis of one quality over the other, as the court below found was the case with the laterally flexible webs in the Gulick device, the statute requires that emphasis to be revealed to the members of the public, who are entitled to know what invention is claimed. That is not accomplished either by naming a member having inherent antithetical properties or by ascribing to it one property when the other is meant. Since rigidity is a relative term, the characterization of the structure as rigid must be taken as emphasizing rigidity rather than its opposite, flexibility, with special reference to the conditions to be encountered in the operation of the piston. Even if those skilled in the art would have known that a piston with webs which would yield enough laterally to accommodate the constriction of the split skirt under the pressure developed by thermal expansion would work most effectively if the webs were laterally flexible rather than rigid, that was not the inven-

tion which Gulick described by his references to an extremely rigid web.

Gulick also failed to explain the principle of his machine so as to distinguish it from the prior art. Webs having the inherent properties both of rigidity and flexibility were familiar elements in piston structure. The court below, after pointing out that the slots of the Franquist skirt rendered it capable of limited constriction, found a distinguishing feature of Gulick's piston to be a web relatively flexible laterally, so as to accomodate the constriction of skirt to thermal expansion, the combination operating to secure a "balanced flexibility" of the skirt. But that principle—facilitating skirt constriction rather than obstructing it—was first explained and its embodiment in the flexible-webbed device was first claimed by the amendments to the application.

As already indicated, the omission from the specifications was not supplied by the drawings, which failed to disclose by dimensions the proportions of the webs. Inherent flexibility of the web in cooperation with the slit skirt cannot be depended upon to produce the desired effect in rendering the skirt yieldable in response to cylinder wall pressure. As respondent's own expert testified, that depends upon design of the web, with correct proportioning of the different parts as to location and thickness to produce lateral flexibility. Inherent rigidity, made more effective by design of the webs, would correspondingly curtail the desired effect.

We recognize the weight to be attached to the determinations in the interference proceedings in which the Court of Appeals of the District of Columbia and the Court of Customs and Patent Appeals sustained the Gulick amendments. Cf. *Radio Corporation* v. *Radio Laboratories*, 293 U. S. 1, 7. But the decisions in those cases are not controlling here. So far as the courts relied on the inherent flexibility of the webs to supply the feature of lateral flexibility omitted from the Gulick description they ignored the principle recognized in *Permutit* v. *Graver Corporation*, *supra*, and *Powers-Kennedy* v. *Concrete Co.*, *supra*. So far as they relied on the drawings to supply the omission they disregarded the fact shown both by inspection and by the evidence presented here that the drawings do no more to point to Gulick's invention than does the fact of inherent flexibility. We conclude that respondent can take no benefit from the flexible web element added by amendment to the Gulick application.

In sustaining the claims of the Maynard patent the court below said that "Maynard . . . embodies the Gulick combination of skirt insulation, skirt flexibility by means of vertical slotting cooperating with longitudinal slotting, and flexible webs in the region of the wrist pin bosses. He also follows Jardine's simplified design to permit economical manufacture and Jardine's boss relief", and after enumerating certain mechanical features of the Maynard construction differing from Gulick and Jardine, concluded: "It is clear that Maynard, while not departing from the teaching of Gulick in basic combination of elements, discloses a piston lighter and more economical of manufacture than Gulick and one more rugged and durable than Jardine." 92 F. (2d), at 337.

Invention over Gulick and Jardine was apparently found in the details of construction but, as we are without other indication of the character of the invention, we construe the court's opinion as including the laterally flexible webs as an essential element in the patented combination. As flexible webs are neither described in Maynard's specifications nor mentioned in his claims, they can be imported into them only by reference to the drawings or by inference from the inherent flexibility of the structure, which, for reasons already given in our consideration of the Gulick amendments, are insufficient to accomplish that result. We conclude that the court below erred in giving any effect to so much of the Gulick patent as by amendment describes or claims the flexible webs, and in treating any of the specifications or claims in Gulick and Maynard as referring to such webs. We assume that it sustained Claim 1 of the Gulick patent, which makes no mention of web flexibility, only by reading into it that element, which the court regarded as an essential part of the invention.

As the Court of Appeals did not pass upon other questions in the case, the causes will be reversed and remanded to it for further proceedings, in conformity with this opinion, with respect to such claims of the patents in suit as appellant below submitted to that court for adjudication.

Reversed.

Mr. Justice Roberts took no part in the consideration or decision of this case.
